GAZYVA Dosing & Administration Guide

Indications
GAZYVA is a CD20-directed cytolytic antibody and is indicated:
• In combination with chemotherapy followed by GAZYVA monotherapy in patients achieving at least a partial remission, for the treatment of adult patients with previously untreated stage II bulky, III or IV follicular lymphoma (FL)
• In combination with bendamustine followed by GAZYVA monotherapy, for the treatment of patients with follicular lymphoma who relapsed after, or are refractory to, a rituximab-containing regimen
• In combination with chlorambucil, for the treatment of patients with previously untreated chronic lymphocytic leukemia (CLL)

Select Important Safety Information
BOXED WARNINGS: HEPATITIS B VIRUS REACTIVATION AND PROGRESSIVE MULTIFOCAL LEukoencephalopathy
• Hepatitis B Virus (HBV) reactivation, in some cases resulting in fulminant hepatitis, hepatic failure, and death, can occur in patients receiving CD20-directed cytolytic antibodies, including GAZYVA. Screen all patients for HBV infection before treatment initiation. Monitor HBV positive patients during and after treatment with GAZYVA. Discontinue GAZYVA and concomitant medications in the event of HBV reactivation
• Progressive Multifocal Leukoencephalopathy (PML) including fatal PML, can occur in patients receiving GAZYVA

Please see additional Important Safety Information throughout as well as accompanying full Prescribing Information, including BOXED WARNINGS.
GAZYVA Dosing & Administration Guide

This guide has been created to help provide information on approved GAZYVA based regimens for the treatment of appropriate patients with:

- Previously untreated stage II bulky, III, or IV follicular lymphoma (FL)
- Follicular lymphoma who relapsed after, or are refractory to, a rituximab-containing regimen
- Previously untreated chronic lymphocytic leukemia (CLL)

For your convenience, this guide has been organized in 2 sections to highlight the differences in GAZYVA use in FL and CLL. Please be sure to refer to the appropriate section for the patient you are treating.

GAZYVA for the Treatment of Follicular Lymphoma

Indications
GAZYVA is a CD20-directed cytolytic antibody and is indicated:
• In combination with chemotherapy followed by GAZYVA monotherapy in patients achieving at least a partial remission for the treatment of adult patients with previously untreated stage II bulky, III or IV follicular lymphoma (FL)
• In combination with bendamustine followed by GAZYVA monotherapy for the treatment of patients with FL who relapsed after, or are refractory to, a rituximab-containing regimen

Select Important Safety Information
BOXED WARNINGS: HEPATITIS B VIRUS REACTIVATION AND PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY
• Hepatitis B Virus (HBV) reactivation, in some cases resulting in fulminant hepatitis, hepatic failure, and death, can occur in patients receiving CD20-directed cytolytic antibodies, including GAZYVA. Screen all patients for HBV infection before treatment initiation. Monitor HBV positive patients during and after treatment with GAZYVA. Discontinue GAZYVA and concomitant medications in the event of HBV reactivation
• Progressive Multifocal Leukoencephalopathy (PML) including fatal PML, can occur in patients receiving GAZYVA

Preparing to Administer GAZYVA

Prepare the solution for infusion, using aseptic technique, as follows:
1. Inspect visually for any particulate matter and discoloration prior to administration
2. Dilute into a 0.9% sodium chloride PVC or non-PVC polyolefin infusion bag. Do not use other diluents such as dextrose (5%)
3. Preparation of solution for infusion for all doses:
   • Withdraw 40 mL of GAZYVA solution from the vial
   • Dilute 40 mL (1,000 mg) into a 250 mL 0.9% sodium chloride infusion bag
4. Mix diluted solution by gentle inversion. Do not shake or freeze
5. For microbiological stability, the diluted GAZYVA infusion solution should be used immediately. Dilute under appropriate aseptic conditions. If not used immediately, the solution may be stored in a refrigerator at 2°C to 8°C (36°F to 46°F) for up to 24 hours prior to use

The product can be administered at a final concentration of 0.4 mg/mL to 4 mg/mL.

Dosage forms and strengths
• 1,000 mg/40 mL (25 mg/mL) single-dose vial

Premedication & administration
• Premedicate before each infusion
• Provide prophylactic hydration and antihyperuricemics to patients at high risk of tumor lysis syndrome
• Administer only as an intravenous infusion through a dedicated line
• Do not administer as an intravenous push or bolus
• Monitor blood counts at regular intervals
• GAZYVA should only be administered by a healthcare professional with appropriate medical support to manage severe infusion reactions that can be fatal if they occur

For information on how to properly store GAZYVA, please refer to the enclosed full Prescribing Information.
For Follicular Lymphoma

**Dosing Schedule**

<td>1,000 mg</td>
</tr>
</tbody>
</table>

**Premedication & administration**

- Premedicate before each infusion
- Provide prophylactic hydration and antihyperuricemics to patients at high risk of tumor lysis syndrome
- Administer only as an intravenous infusion through a dedicated line
- Do not administer as an intravenous push or bolus
- Monitor blood counts at regular intervals
- GAZYVA should only be administered by a healthcare professional with appropriate medical support to manage severe infusion reactions that can be fatal if they occur
- If a planned dose of GAZYVA is missed, administer the missed dose as soon as possible. During GAZYVA and chemotherapy treatment, adjust the dosing schedule accordingly to maintain the time interval between chemotherapy doses. During monotherapy, maintain the original dosing schedule for subsequent doses. Monotherapy should be initiated approximately 2 months after the last induction dose of GAZYVA

**Chemotherapy Regimen Dosing**

**Previously untreated FL:**

- **Bendamustine:** When combined with GAZYVA, bendamustine is administered at 90 mg/m² IV on Days 1 and 2 with prednisone 100 mg orally or equivalent on Day 1 of Cycle 1 for six 28-day cycles
- **CVP:** When combined with standard dosing of CVP, GAZYVA is administered over eight 21-day cycles
- **CHOP:** When combined with standard dosing of CHOP, GAZYVA is administered over six 21-day cycles followed by 2 additional cycles of GAZYVA alone, for a total of 8 GAZYVA cycles
- Patients who achieve a complete or partial response to the initial 6 or 8 cycles of GAZYVA treatment in combination with chemotherapy should continue on GAZYVA 1,000 mg as monotherapy every 2 months for up to 2 years

**Relapsed or refractory FL:**

- When combined with GAZYVA, bendamustine is administered at 90 mg/m² IV on Days 1 and 2 for six 28-day cycles
- Patients who achieve a complete response, partial response, or stable disease to the first 6 cycles of GAZYVA + bendamustine should continue on GAZYVA monotherapy every 2 months for up to 2 years

Please see additional Important Safety Information throughout as well as accompanying full Prescribing Information, including BOXED WARNINGS.
**Recommended GAZYVA Infusion Rates**

For Follicular Lymphoma

Dilute GAZYVA with 0.9% sodium chloride to achieve a final concentration ranging from 0.4 mg/mL to 4 mg/mL.

- Do not use other diluents such as dextrose (5%)

**Cycle 1, Day 1 (1,000 mg dose):**
- Administer at 50 mg/hr. The rate of the infusion can be escalated in 50 mg/hr increments every 30 minutes to a maximum of 400 mg/hr

**Cycle 1, Days 8 & 15; Cycles 2-6 or 2-8; Monotherapy (1,000 mg dose):**
- If no infusion reaction or an infusion reaction of Grade 1 occurred during the previous infusion and the final infusion rate was 100 mg/hr or faster, infusions can be started at a rate of 100 mg/hr and increased by 100 mg/hr increments every 30 minutes to a maximum of 400 mg/hr
- If an infusion reaction of Grade 2 or higher occurred during the previous infusion, administer at 50 mg/hr. The rate of infusion can be escalated in increments of 50 mg/hr every 30 minutes to a maximum rate of 400 mg/hr

This chart is provided as an example. Total volumes in IV bag could differ depending on overfill, withdrawal, and addition of fluid. Some numbers have been rounded.

1. When preparing a 1,000 mg dose for infusion, the PI recommends diluting 1,000 mg into a 250 mL 0.9% sodium chloride bag. GAZYVA can be administered at a final concentration of 0.4 mg/mL to 4 mg/mL.
Recommended Premedications

The following premedications are recommended before GAZYVA infusion begins to reduce the risk of infusion-related reactions (IRRs)\(^1\):

<table>
<thead>
<tr>
<th>Complete before infusion</th>
<th>Cycle 1: Day 1</th>
<th>All Subsequent Infusions</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>All patients</td>
<td>All patients</td>
</tr>
<tr>
<td></td>
<td>Patients with an IRR (Grade 1-2) with the previous infusion</td>
<td>Patients with a Grade 3 IRR with the previous infusion OR with a lymphocyte count &gt;25 (10^9/L) prior to next treatment</td>
</tr>
</tbody>
</table>

- **60 MINUTES PRIOR** Intravenous glucocorticoid\(^a\)
- **30 MINUTES PRIOR** Antihistamine\(^c\)
- **30 MINUTES PRIOR** Acetaminophen\(^d\)

\(^{a}\) 20 mg dexamethasone or 80 mg methylprednisolone. Hydrocortisone is not recommended as it has not been effective in reducing the rate of infusion reactions.

\(^{c}\) If a glucocorticoid-containing chemotherapy regimen is administered on the same day as GAZYVA, the glucocorticoid can be administered as an oral medication if given at least 1 hour prior to GAZYVA, in which case additional intravenous glucocorticoid as premedication is not required.

\(^{d}\) Eg, 50 mg diphenhydramine.

\(^{e}\) 650-1,000 mg.

Premedication and close monitoring are recommended for all patients\(^1\):

- Patients with preexisting cardiac or pulmonary conditions are at a greater risk of experiencing more severe infusion reactions
- Hypotension may occur during GAZYVA intravenous infusions. Consider withholding anthypertensive treatments for 12 hours prior to and throughout each GAZYVA infusion and for the first hour after administration
- Patients with high tumor burden, high circulating absolute lymphocyte counts (greater than 25 \(10^9/L\)), or renal impairment are considered at risk of tumor lysis syndrome and should receive prophylaxis. Premedicate with antihyperuricemics (eg, allopurinol or rasburicase) and ensure adequate hydration prior to start of GAZYVA therapy. Continue prophylaxis prior to each subsequent GAZYVA infusion, as needed
- Patients with Grade 3 to 4 neutropenia lasting more than one week are strongly recommended to receive antimicrobial prophylaxis until resolution of neutropenia to Grade 1 or 2. Antiviral and antifungal prophylaxis should be considered

Please see additional Important Safety Information throughout as well as accompanying full Prescribing Information, including BOXED WARNINGS.

Incidence of IRRs in the GALLIUM Trial: Previously Untreated NHL

Infusion-related reactions (IRRs) with GAZYVA may be severe and life threatening, and can occur at any time\(^1\):

- Symptoms may include hypotension, tachycardia, dyspnea, and respiratory symptoms (eg, bronchospasm, larynx and throat irritation, wheezing, laryngeal edema)
- Most frequently reported symptoms include nausea, fatigue, chest discomfort, dyspnea, dizziness, vomiting, diarrhea, constipation, rash, hyperventilation, flushing, headache, pyrexia, and chills

For Follicular Lymphoma

<td>2</td>
</tr>
</tbody>
</table>

\(^{1}\) Per study protocol, GAZYVA was administered on Days 1, 8 and 15 of Cycle 1 and rituximab product was administered on Day 1 of Cycle 1.

\(^{3}\) In the rituximab product arm, <1% of patients experienced an IRR leading to treatment discontinuation.
Incidence of IRRs in the GADOLIN Trial: Relapsed or Refractory NHL

Incidence of IRRs by treatment cycle in relapsed or refractory NHL\(^1,2\)
- Patients relapsed or were refractory to a rituximab product-containing regimen

IRRs for Cycle 1\(^1\):
- Grade 3-4 IRRs: 9%, All Grade IRRs: 55%
- The incidence of infusion reactions was highest on Day 1 (38%), and gradually decreased on Days 2, 3, 8, and 15 (25%, 7%, and 4%, respectively)

IRRs for subsequent cycles\(^1,2\):
- Grade 3-4 IRRs: 1% in Cycle 2, 2% in Cycle 3, 1% in Cycle 4; absent in Cycles 5-6 and GAZYVA monotherapy
- All Grade IRRs: 24% in Cycle 2, 22% in Cycle 3, 14% in Cycle 4, 15% in Cycle 5, 10% in Cycle 6, and 8% in GAZYVA monotherapy

Overall IRR incidence rates during treatment with GAZYVA + bendamustine followed by GAZYVA monotherapy\(^1\):
- Grade 3-4 IRRs: 11%
- All Grade IRRs: 69%

\(^1\)Day 3 consisted of bendamustine only.

Please see additional Important Safety Information throughout as well as accompanying full Prescribing Information, including BOXED WARNINGS.

### Adjusting Infusions in Case of IRRs\(^1\)

If a patient experiences an infusion reaction of any grade during infusion, adjust the infusion as follows:

<table>
<thead>
<tr>
<th>Infusion Reactions</th>
<th>CTCAE v5.0 Description(^2)</th>
<th>Recommendations per Prescribing Information(^1)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Grade 4 (life threatening)</td>
<td>Life-threatening consequences; urgent intervention indicated</td>
<td>Stop infusion immediately and permanently discontinue GAZYVA therapy</td>
</tr>
<tr>
<td>Grade 3 (severe)</td>
<td>Prolonged (eg, not rapidly responsive to symptomatic medication and/or brief interruption of infusion); recurrence of symptoms following initial improvement; hospitalization indicated for clinical sequelae</td>
<td>Interrupt infusion and manage symptoms</td>
</tr>
<tr>
<td>Grades 1-2 (mild to moderate)</td>
<td>Therapy or infusion interruption indicated but responds promptly to symptomatic treatment (eg, antihistamines, NSAIDs, narcotics, IV fluids); prophylactic medications indicated for ≤24 hrs</td>
<td>Reduce infusion rate or interrupt infusion and treat symptoms</td>
</tr>
</tbody>
</table>

CTCAE: Common Terminology Criteria for Adverse Events.

- Closely monitor patients during the entire infusion. Infusion reactions within 24 hours of receiving GAZYVA have occurred
- Institute medical management (eg, glucocorticoids, epinephrine, bronchodilators, and/or oxygen) for infusion reactions
GAZYVA in Combination with Chlorambucil for the First-line Treatment of Chronic Lymphocytic Leukemia

Indication
GAZYVA, in combination with chlorambucil, is indicated for the treatment of patients with previously untreated chronic lymphocytic leukemia (CLL).

BOXED WARNINGS: HEPATITIS B VIRUS REACTIVATION AND PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY
• Hepatitis B Virus (HBV) reactivation, in some cases resulting in fulminant hepatitis, hepatic failure, and death, can occur in patients receiving CD20-directed cytolytic antibodies, including GAZYVA. Screen all patients for HBV infection before treatment initiation. Monitor HBV positive patients during and after treatment with GAZYVA. Discontinue GAZYVA and concomitant medications in the event of HBV reactivation
• Progressive Multifocal Leukoencephalopathy (PML) including fatal PML, can occur in patients receiving GAZYVA

Prepare the solution for infusion, using aseptic technique, as follows:

1. Inspect visually for any particulate matter and discoloration prior to administration

2. Dilute into a 0.9% sodium chloride PVC or non-PVC polyolefin infusion bag. Do not use other diluents such as dextrose (5%)

3. Preparation of solution for infusion on:
   • Day 1 (100 mg) and Day 2 (900 mg) of Cycle 1:
     – Withdraw 40 mL of GAZYVA solution from the vial
     – Dilute 4 mL (100 mg) of GAZYVA into a 100 mL 0.9% sodium chloride infusion bag for immediate administration
     – Dilute the remaining 36 mL (900 mg) into a 250 mL 0.9% sodium chloride infusion bag at the same time for use on Day 2 and store at 2°C to 8°C (36°F to 46°F) for up to 24 hours. After allowing the diluted bag to come to room temperature, use immediately
     – Clearly label each infusion bag
   • Days 8 and 15 of Cycle 1 and Day 1 of Cycles 2-6:
     – Withdraw 40 mL of GAZYVA solution from the vial
     – Dilute 40 mL (1,000 mg) into a 250 mL 0.9% sodium chloride infusion bag

4. Mix diluted solution by gentle inversion. Do not shake or freeze

5. For microbiological stability, the diluted GAZYVA infusion solution should be used immediately. Dilute under appropriate aseptic conditions. If not used immediately, the solution may be stored in a refrigerator at 2°C to 8°C (36°F to 46°F) for up to 24 hours prior to use

The product can be administered at a final concentration of 0.4 mg/mL to 4 mg/mL.

Dosage forms and strengths
• 1,000 mg/40 mL (25 mg/mL) single-dose vial

For information on how to properly store GAZYVA, please refer to the enclosed full Prescribing Information.
Previously Untreated Chronic Lymphocytic Leukemia

6-Cycle Dosing Schedule

Each dose of GAZYVA is 1,000 mg administered intravenously with the exception of the first infusions in Cycle 1, which are administered on Day 1 (100 mg) and Day 2 (900 mg)

<table>
<thead>

</tbody>
</table>

Chlorambucil should be given 0.5 mg/kg orally on Days 1 and 15 of Cycles 1-6

- If a planned dose of GAZYVA is missed, administer the missed dose as soon as possible and adjust dosing schedule accordingly
- If appropriate, patients who do not complete the Day 1 Cycle 1 dose may proceed to the Day 2 Cycle 1 dose
- Consider treatment interruption if patients experience an infection, Grade 3 or 4 cytopenia, or a ≥Grade 2 non-hematologic toxicity

Premedication & administration

- Premedicate before each infusion
- Provide prophylactic hydration and antihyperuricemics to patients at high risk of tumor lysis syndrome
- Administer only as an intravenous infusion through a dedicated line
- Do not administer as an intravenous push or bolus
- Monitor blood counts at regular intervals
- GAZYVA should only be administered by a healthcare professional with appropriate medical support to manage severe infusion reactions that can be fatal if they occur

Please see additional Important Safety Information throughout as well as accompanying full Prescribing Information, including BOXED WARNINGS.

Recommended Premedications

The following premedications are recommended before GAZYVA infusion begins to reduce the risk of infusion-related reactions (IRRs)

<table>
<thead>
<tr>
<th>Complete before infusion</th>
<th>Cycle 1: Days 1 and 2</th>
<th>All Subsequent Infusions</th>
</tr>
</thead>
<tbody>
<tr>
<td>All patients</td>
<td>All patients</td>
<td>Patients with an IRR (Grade 1-2) with the previous infusion</td>
</tr>
<tr>
<td>Patients with a Grade 3 IRR with the previous infusion or with a lymphocyte count &gt;25 x 10⁹/L prior to next treatment</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Recommended Premedications

- Antihistamine
- Acetaminophen
- Intravenous glucocorticoid

- Complete before infusion
- 60 MINUTES PRIOR
- 30 MINUTES PRIOR
- 30 MINUTES PRIOR

*20 mg dexamethasone or 80 mg methylprednisolone. Hydrocortisone is not recommended as it has not been effective in reducing the rate of infusion reactions.

*If a glucocorticoid-containing chemotherapy regimen is administered on the same day as GAZYVA, the glucocorticoid can be administered as an oral medication if given at least 1 hour prior to GAZYVA, in which case additional intravenous glucocorticoid as premedication is not required.

*Eq: 50 mg dexamethasone.

*650-1,000 mg.

Premedication and close monitoring are recommended for all patients

- Patients with preexisting cardiac or pulmonary conditions are at a greater risk of experiencing more severe infusion reactions
- Hypotension may occur during GAZYVA intravenous infusions. Consider withholding antihypertensive treatments for 12 hours prior to and throughout each GAZYVA infusion and for the first hour after administration
- Patients with high tumor burden, high circulating absolute lymphocyte counts (greater than 25 x 10⁹/L), or renal impairment are considered at risk of tumor lysis syndrome and should receive prophylaxis. Premedicate with antihyperuricemics (eg, allopurinol or rasburicase) and ensure adequate hydration prior to start of GAZYVA therapy. Continue prophylaxis prior to each subsequent GAZYVA infusion, as needed
- Patients with Grade 3 to 4 neutropenia lasting more than one week are strongly recommended to receive antimicrobial prophylaxis until resolution of neutropenia to Grade 1 or 2. Antiviral and antifungal prophylaxis should be considered

Please see additional Important Safety Information throughout as well as accompanying full Prescribing Information, including BOXED WARNINGS.
Recommended GAZYVA Infusion Rates

Dilute GAZYVA with 0.9% sodium chloride to achieve a final concentration ranging from 0.4 mg/mL to 4 mg/mL.
• Do not use other diluents such as dextrose (5%)

Cycle 1, Day 1 (100 mg dose):
• Administer at 25 mg/hr over 4 hours. Do not increase the infusion rate
• The Day 1 dose for GAZYVA is 100 mg in 100 mL

Cycle 1, Day 2 (900 mg dose):
• If no infusion reaction occurred during the previous infusion, administer at 50 mg/hr. The rate of the infusion can be escalated in increments of 50 mg/hr every 30 minutes to a maximum rate of 400 mg/hr
• If an infusion reaction occurred during the previous infusion, administer at 25 mg/hr. The rate of infusion can be escalated in increments of up to 50 mg/hr every 30 minutes to a maximum rate of 400 mg/hr

Cycle 1, Days 8 &15; Cycles 2-6 (1,000 mg dose):
• If no infusion reaction occurred during the previous infusion and the final infusion rate was 100 mg/hr or faster, infusions can be started at a rate of 100 mg/hr and increased by 100 mg/hr increments every 30 minutes to a maximum of 400 mg/hr
• If an infusion reaction occurred during the previous infusion, administer at 50 mg/hr. The rate of infusion can be escalated in increments of 50 mg/hr every 30 minutes to a maximum rate of 400 mg/hr

Recommended GAZYVA Infusion Rates at Selected Concentrations

If your desired mg/hr is: | At a 4 mg/mL concentration (1,000 mg in 250 mL), administer at: | At a 2 mg/mL concentration (1,000 mg in 500 mL), administer at: | At a 1 mg/mL concentration (1,000 mg in 1,000 mL), administer at:
---|---|---|---
25 mg/hr | N/A | N/A | 25 mL/hr
50 mg/hr | 13 mL/hr | 25 mL/hr | 50 mL/hr
100 mg/hr | 25 mL/hr | 50 mL/hr | 100 mL/hr
150 mg/hr | 38 mL/hr | 75 mL/hr | 150 mL/hr
200 mg/hr | 50 mL/hr | 100 mL/hr | 200 mL/hr
250 mg/hr | 63 mL/hr | 125 mL/hr | 250 mL/hr
300 mg/hr | 75 mL/hr | 150 mL/hr | 300 mL/hr
350 mg/hr | 88 mL/hr | 175 mL/hr | 350 mL/hr
400 mg/hr | 100 mL/hr | 200 mL/hr | 400 mL/hr

*The Day 1 dose for GAZYVA is 100 mg in 100 mL.
This chart is provided as an example. Total volumes in IV bag could differ depending on overfill, withdrawal, and addition of fluid. Some numbers have been rounded.
When preparing a 1,000 mg dose for infusion, the PI recommends diluting 1,000 mg into a 250 mL 0.9% sodium chloride bag. GAZYVA can be administered at a final concentration of 0.4 mg/mL to 4 mg/mL.
Hydrocortisone is not recommended as it has not been effective in reducing the rate of infusion reactions.

Infusion Reactions CTCAE v5.0 Description 1

Grade
4
(life threatening)
Life-threatening consequences; urgent intervention indicated
Stop infusion immediately and permanently discontinue GAZYVA therapy

Grade 3
(severe)
Prolonged (eg, not rapidly responsive to symptomatic medication and/or brief interruption of infusion); recurrence of symptoms following initial improvement; hospitalization indicated for clinical sequelae
Interrupt infusion and manage symptoms
• Upon resolution of symptoms, consider restarting GAZYVA infusion at no more than half the previous rate (the time that the infusion reaction occurred) and, if patient does not experience any further infusion reaction symptoms, infusion rate escalation may resume at the increments and intervals as appropriate for the treatment cycle dose
• Permanently discontinue treatment if patient experiences a Grade 3 infusion-related symptom at rechallenge
– For CLL patients only, the Day 1 infusion rate may be increased back up to 25 mg/hr after 1 hour but not increased further

Grade 1-2
(mild to moderate)
Mild transient reaction; infusion interruption not indicated; intervention not indicated
Reduce infusion rate or interrupt infusion and treat symptoms
• Upon resolution of symptoms, continue or resume infusion and, if patient does not experience any further infusion reaction symptoms, infusion rate escalation may resume at the increments and intervals as appropriate for the treatment cycle dose
– For CLL patients only, the Day 1 infusion rate may be increased back up to 25 mg/hr after 1 hour but not increased further

% of the GAZYVA treated arm discontinued therapy due to an IRR

 Previously Untreated Chronic Lymphocytic Leukemia

Incidence of Infusion Reactions

IRRs with GAZYVA may be severe and life threatening and can occur at any time1

• Symptoms may include hypotension, tachycardia, dyspnea, and respiratory symptoms (eg, bronchospasm, larynx and throat irritation, wheezing, laryngeal edema)
• Most frequently reported symptoms include nausea, fatigue, dizziness, vomiting, diarrhea, hypertension, flushing, headache, pyrexia, and chills

First 1,000 mg infused: 65% of patients experienced IRRs with GAZYVA1

• Grade 3 or 4 reactions occurred in 20% of patients

Subsequent infusions: IRRs also occurred1

• The incidence of IRRs with subsequent infusions was 3% with the second 1,000 mg and <1% thereafter
• There were no Grade 3 or 4 IRRs reported after the first 1,000 mg infused

Protocol modifications were implemented to help mitigate infusion reactions1

• Protocol modifications in CLL-11 required premedication with a corticosteroid,* an antihistamine, and acetaminophen. The first 1,000 mg dose was also divided into 2 infusions (100 mg on Day 1 and 900 mg on Day 2)

Before Protocol Modifications (n=53)

• 89% of patients experienced an infusion reaction

After Protocol Modifications (n=140)

• 53% of patients experienced a reaction with the first 1,000 mg and <3% thereafter

*Hydrocortisone is not recommended as it has not been effective in reducing the rate of infusion reactions.

Previously Untreated Chronic Lymphocytic Leukemia

Adjusting Infusions in Case of IRRs 1

If a patient experiences an infusion reaction of any grade during infusion, adjust the infusion as follows:

CTCAE, Common Terminology Criteria for Adverse Events.
Important Safety Information

**BOXED WARNINGS: HEPATITIS B VIRUS REACTIVATION AND PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY**

- Hepatitis B Virus (HBV) reactivation, in some cases resulting in fulminant hepatitis, hepatic failure, and death, can occur in patients receiving CD20-directed cytolytic antibodies, including GAZYVA. Screen all patients for HBV infection before treatment initiation. Monitor HBV positive patients during and after treatment with GAZYVA. Discontinue GAZYVA and concomitant medications in the event of HBV reactivation
- Progressive Multifocal Leukoencephalopathy (PML) including fatal PML, can occur in patients receiving GAZYVA

**Contraindications**

- GAZYVA is contraindicated in patients with known hypersensitivity reactions (e.g. anaphylaxis) to obinutuzumab or to any of the excipients, or serum sickness with prior obinutuzumab use

**Warnings and Precautions**

**Hepatitis B Virus Reactivation**

- Hepatitis B virus (HBV) reactivation, in some cases resulting in fulminant hepatitis, hepatic failure, and death, can occur in patients treated with anti-CD20 antibodies including GAZYVA. HBV reactivation has been reported in patients who are hepatitis B surface antigen (HBsAg) positive and in patients who are HBsAg negative but are hepatitis B core antibody (anti-HBc) positive. Reactivation has also occurred in patients who appear to have resolved hepatitis B infection (ie, HBsAg negative, anti-HBc positive, and hepatitis B surface antibody [anti-HBs] positive)
- HBV reactivation is defined as an abrupt increase in HBV replication manifesting as a rapid increase in serum HBV DNA level, or detection of HBsAg in a person who was previously HBsAg negative and anti-HBc positive. Reactivation of HBV replication is often followed by hepatitis, ie, increase in transaminase levels and, in severe cases, increase in bilirubin levels, liver failure, and death
- Screen all patients for HBV infection by measuring HBsAg and anti-HBc before initiating treatment with GAZYVA. For patients who show evidence of hepatitis B infection (HBsAg positive [regardless of antibody status] or HBsAg negative but anti-HBc positive), consult physicians with expertise in managing hepatitis B regarding monitoring and consideration for HBV antiviral therapy
- Monitor patients with evidence of current or prior HBV infection for clinical and laboratory signs of hepatitis or HBV reactivation during and for several months following treatment with GAZYVA
- In patients who develop reactivation of HBV while receiving GAZYVA, immediately discontinue GAZYVA and any concomitant chemotherapy and institute appropriate treatment. Resumption of GAZYVA in patients whose HBV reactivation resolves should be discussed with physicians with expertise in managing hepatitis B. Insufficient data exist regarding the safety of resuming GAZYVA in patients who develop HBV reactivation

**Precautions**

- The risk of HBV reactivation may be higher in patients whose hepatitis B infection has been suppressed with antiviral therapy as compared to patients with a history of hepatitis B without prior antiviral therapy
- Monitor HBV positive patients during and after treatment with GAZYVA. Discontinue GAZYVA and concomitant medications in cases of HBV reactivation
- Patients with known hepatitis B core surface antigen (HBV) infection should have complete blood work with liver function tests performed immediately before therapy initiation and every 1-2 months thereafter
- Patients with evidence of current or past hepatitis B infection should be monitored closely and be counseled regarding the importance of monitoring for signs of HBV reactivation

**Hepatitis B Virus Reactivation (cont’d)**

- In patients with a history of chronic hepatitis B infection, concomitant antiviral therapy (e.g., nucleoside or nucleotide analogs) should be continued throughout GAZYVA therapy
- Monitor HBV infected patients for evidence of HBV reactivation during GAZYVA treatment and for several months following treatment. In patients where HBV reactivation occurs, consult physicians with expertise in managing hepatitis B regarding monitoring and consideration for HBV antiviral therapy

**Hypersensitivity Reactions Including Serum Sickness**

- Hypersensitivity reactions have been reported in patients treated with GAZYVA. Signs of immediate-onset hypersensitivity include dyspnea, bronchospasm, hypotension, urticaria and tachycardia. Late-onset hypersensitivity diagnosed as serum sickness has also been reported with symptoms that include chest pain, diffuse arthralgia and fever. Hypersensitivity reactions may be difficult to clinically distinguish from infusion related reactions. However, hypersensitivity very rarely occurs with the first infusion and, when observed, usually occur after previous exposure. If a hypersensitivity reaction is suspected during or after an infusion, the infusion must be stopped and treatment permanently discontinued. Patients with known hypersensitivity reactions to GAZYVA, including serum sickness, must not be retreated

**Infusion Reactions**

- GAZYVA can cause severe and life-threatening infusion reactions. Sixty-five percent of patients with CLL experienced a reaction to the first 1000 mg infused. Thirty-eight percent of patients with relapsed or refractory NHL and 60% of patients with previously untreated NHL experienced a reaction on Day 1 of GAZYVA infusion. Infusion reactions can also occur with subsequent infusions. Symptoms may include hypotension, tachycardia, dyspnea, and respiratory symptoms (e.g., bronchospasm, larynx and throat irritation, wheezing, and laryngeal edema). Most frequently reported symptoms include nausea, fatigue, chest discomfort, dyspnea, dizziness, vomiting, diarrhea, rash, hypertension, hypotension, flushing, headache, pyrexia, and chills
- Premedicate patients with acetaminophen, an antihistamine, and a glucocorticoid. Institute medical management for infusion reactions as needed. Closely monitor patients during the entire infusion. Infusion reactions within 24 hours of receiving GAZYVA have occurred
- For patients with any Grade 4 infusion reactions, including but not limited to anaphylaxis, acute life-threatening respiratory symptoms, or other life-threatening infusion reaction: Stop the GAZYVA infusion. Permanently discontinue GAZYVA therapy
- For patients with Grade 1, 2, or 3 infusion reactions: Interrupt GAZYVA for Grade 3 reactions until resolution of symptoms. Interrupt or reduce the rate of the infusion for Grade 1 or 2 reactions and manage symptoms
- For patients with preexisting cardiac or pulmonary conditions, monitor more frequently throughout the infusion and the post-infusion period since they may be at greater risk of experiencing more severe reactions. Hypotension may occur as part of the GAZYVA infusion reaction. Consider withholding antihypertensive treatments for 12 hours prior to and during each GAZYVA infusion, and for the first hour after administration until blood pressure is stable. For patients at increased risk of hypertensive crisis, consider the benefits versus the risks of withholding their antihypertensive medication

**Progressive Multifocal Leukoencephalopathy (PML)**

- JC virus infection resulting in PML, which can be fatal, was observed in patients treated with GAZYVA. Consider the diagnosis of PML in any patient presenting with new onset or changes to preexisting neurologic manifestations. Evaluation of PML includes, but is not limited to, consultation with a neurologist, brain MRI, and lumbar puncture. Discontinue GAZYVA therapy and consider discontinuation or reduction of any concomitant chemotherapy or immunosuppressive therapy in patients who develop PML

Please see additional Important Safety Information throughout as well as accompanying full Prescribing Information, including BOXED WARNINGS.
Important Safety Information (cont’d)

Tumor Lysis Syndrome (TLS)

- Tumor lysis syndrome, including fatal cases, has been reported in patients receiving GAZYVA. Patients with high tumor burden, high circulating lymphocyte count (>25 x 10^9/L) or renal impairment are at greater risk for TLS and should receive appropriate tumor lysis prophylaxis with antihyperuricemics (eg, allopurinol or rasburicase) and hydration prior to the infusion of GAZYVA. During the initial days of GAZYVA treatment, monitor the laboratory parameters of patients considered at risk for TLS. For treatment of TLS, correct electrolyte abnormalities, monitor renal function and fluid balance, and administer supportive care, including dialysis as indicated.

Infections

- Fatal and serious bacterial, fungal, and new or reactivated viral infections can occur during and following GAZYVA therapy. When GAZYVA is administered with chemotherapy followed by GAZYVA monotherapy, Grade 3 to 5 infections have been reported in up to 8% of patients during combination therapy, up to 13% of patients during monotherapy, and up to 8% of patients after treatment. Do not administer GAZYVA to patients with an active infection. Patients with a history of recurring or chronic infections may be at increased risk of infection.

- In GALLIUM, more Grade 3 to 5 infections were reported in the recipients of GAZYVA and bendamustine (117/410 patients, 29%), as compared to GAZYVA plus CHOP or CVP (43/281 patients, 15%). More fatal infections were reported in patients treated with GAZYVA and bendamustine (3%), as compared to GAZYVA plus CHOP or CVP (<1%), including during the monotherapy phase and after completion of treatment.

Neutropenia

- Severe and life-threatening neutropenia, including febrile neutropenia, has been reported during treatment with GAZYVA. Monitor patients with Grade 3 to 4 neutropenia frequently with regular laboratory testing until resolution. Anticipate, evaluate, and treat any symptoms or signs of developing infection. Consider administration of granulocyte colony-stimulating factors (GCSF) in patients with Grade 3 or 4 neutropenia.

- Neutropenia can also be of late onset (occurring more than 28 days after completion of treatment) and/or prolonged (lasting longer than 28 days).

- Consider dose delays in the case of Grade 3 or 4 neutropenia. Patients with severe and long lasting (>1 week) neutropenia are strongly recommended to receive antimicrobial prophylaxis until resolution of neutropenia to Grade 1 or 2. Consider antiviral and antifungal prophylaxis.

Thrombocytopenia

- Severe and life-threatening thrombocytopenia has been reported during treatment with GAZYVA in combination with chemotherapy. Fatal hemorrhagic events have been reported in patients with NHL and CLL treated with GAZYVA in combination with chemotherapy, including Cycle 1. Monitor all patients frequently for thrombocytopenia and hemorrhagic events, especially during the first cycle. In patients with Grade 3 or 4 thrombocytopenia, monitor platelet counts more frequently until resolution and consider subsequent dose delays of GAZYVA and chemotherapy or dose reductions of chemotherapy. Transfusion of blood products (i.e., platelet transfusions) may be necessary. Consider withholding concomitant medications which may increase bleeding risk (platelet inhibitors or anticoagulants), especially during the first cycle.

Immunization

- The safety and efficacy of immunization with live or attenuated viral vaccines during or following GAZYVA therapy have not been studied. Immunization with live virus vaccines is not recommended during treatment and until B-cell recovery.

Pregnancy

- There are no data with GAZYVA use in pregnant women to inform a drug-associated risk. GAZYVA is likely to cause fetal B-cell depletion. GAZYVA should be used during pregnancy and/or breastfeeding only if the potential benefit justifies the potential risk to the fetus and/or infant. Mothers who have been exposed to GAZYVA during pregnancy should discuss the safety and timing of live virus vaccinations for their infants with their child’s healthcare providers.

Geriatric Use

- Of 336 patients with previously untreated CLL who received GAZYVA in combination with chlorambucil, 81% were 65 years and older, while 46% were 75 and older. Of the patients 75 years and older, 46% experienced serious adverse reactions and 7% experienced adverse reactions leading to death. Of the patients younger than 75, 33% experienced a serious adverse reaction and 2% an adverse reaction leading to death. No significant differences in efficacy were observed between younger and older patients.

- Of 194 patients in GADOLIN with relapsed or refractory NHL treated with GAZYVA plus bendamustine, 44% were 65 and over, while 14% were 75 and over. In patients 65 and over, 52% of patients experienced serious adverse reactions and 26% experienced adverse reactions leading to treatment withdrawal while in patients under 65, 28% and 12% experienced serious adverse reactions and adverse reactions leading to treatment withdrawal, respectively. No clinically meaningful differences in efficacy were observed between these patients and younger patients.

- Of the 691 patients in GALLIUM treated with GAZYVA plus chemotherapy as first-line therapy, 33% were 65 and over, while 17% were 75 and over. Of patients 65 and over, 63% experienced serious adverse reactions and 26% experienced adverse reactions leading to treatment withdrawal while in patients under 65, 28% and 12% experienced serious adverse reactions and adverse reactions leading to treatment withdrawal, respectively. No clinically meaningful differences in efficacy were observed between these patients and younger patients.

Additional Important Safety Information

CLL

- The most common Grade 3 to 4 adverse reactions (incidence ≥10%) observed in patients with CLL in the GAZYVA containing arm were neutropenia, infusion reactions, and thrombocytopenia.

- The most common adverse reactions (incidence ≥10%) observed in patients with CLL in the GAZYVA containing arm were infusion reactions, neutropenia, thrombocytopenia, anemia, pyrexia, cough, nausea, and diarrhea.

GAZYVA® (obinutuzumab) injection, for intravenous use

Initial U.S. Approval: 2013

**WARNING: HEPATITIS B VIRUS REACTIVATION and PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY**

See full prescribing information for complete boxed warning.

- Hepatitis B Virus (HBV) reactivation, in some cases resulting in fulminant hepatitis, hepatic failure, and death. (5.1)
- Progressive Multifocal Leukoencephalopathy (PML) resulting in death. (5.2)

**RECENT MAJOR CHANGES**

Indications and Usage, Follicular Lymphoma (1.2) 11/2017
Dosage and Administration (2) 11/2017
Warnings and Precautions (5.3, 5.4, 5.6, 5.8) 11/2017
Contraindications (4) 11/2017

**INDICATIONS AND USAGE**

GAZYVA (obinutuzumab) is a CD20-directed cytolytic antibody and is indicated:

- in combination with chlorambucil, for the treatment of patients with previously untreated chronic lymphocytic leukemia. (1, 14)
- in combination with bendamustine followed by GAZYVA monotherapy, for the treatment of patients with follicular lymphoma who relapsed after, or are refractory to, a rituximab-containing regimen. (1, 14)
- in combination with chemotherapy followed by GAZYVA monotherapy in patients achieving at least a partial remission, for the treatment of adult patients with previously untreated stage II bulky, III or IV follicular lymphoma. (1, 14)

**DOSAGE AND ADMINISTRATION**

- Premedicate for infusion reactions and tumor lysis syndrome. (2.2, 5.3, 5.4)
- Dilute and administer as intravenous infusion. Do not administer as an intravenous push or bolus. (2.1)
- The dose for chronic lymphocytic leukemia is 100 mg on day 1 and 900 mg on day 2 of Cycle 1, 1000 mg on day 8 and 15 of Cycle 1, and 1000 mg on day 1 of Cycles 2-6. (2.1)
- The dose for follicular lymphoma is 1000 mg on day 1, 8 and 15 of Cycle 1, 1000 mg on day 1 of Cycles 2-6 or Cycles 2-8, and then 1000 mg every 2 months for up to 2 years. (2.1)

**DOSAGE FORMS AND STRENGTHS**

1000 mg/40 mL (25 mg/mL) single-dose vial. (3)

**FULL PRESCRIBING INFORMATION: CONTENTS**

FULL PRESCRIBING INFORMATION

WARNING: HEPATITIS B VIRUS REACTIVATION and PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY

- Hepatitis B Virus (HBV) reactivation, in some cases resulting in fulminant hepatitis, hepatic failure, and death, can occur in patients receiving CD20-directed cytolytic antibodies, including GAZYVA. Screen all patients for HBV infection before treatment initiation. Monitor HBV-positive patients during and after treatment with GAZYVA. Discontinue GAZYVA and concomitant medications in the event of HBV reactivation [see Warnings and Precautions (5.1)].

- Progressive Multifocal Leukoencephalopathy (PML) including fatal PML, can occur in patients receiving GAZYVA [see Warnings and Precautions (5.2)].

1  INDICATIONS AND USAGE

1.1 Chronic Lymphocytic Leukemia (CLL)

GAZYVA, in combination with chlorambucil, is indicated for the treatment of patients with previously untreated chronic lymphocytic leukemia [see Clinical Studies (14.1)].

1.2 Follicular Lymphoma (FL)

GAZYVA, in combination with bendamustine followed by GAZYVA monotherapy, is indicated for the treatment of patients with follicular lymphoma who relapsed after, or are refractory to, a rituximab-containing regimen [see Clinical Studies (14.2)].

GAZYVA, in combination with chemotherapy followed by GAZYVA monotherapy in patients achieving at least a partial remission, is indicated for the treatment of adult patients with previously untreated stage II bulky, III or IV follicular lymphoma [see Clinical Studies (14.2)].

2  DOSAGE AND ADMINISTRATION

2.1 Recommended Dosage Regimen

- Premedicate before each infusion [see Dosage and Administration (2.2)].

- Provide prophylactic hydration and anti-hyperuricemics to patients at high risk of tumor lysis syndrome [see Dosage and Administration (2.2) and Warnings and Precautions (5.4)].

- Administer only as an intravenous infusion through a dedicated line [see Dosage and Administration (2.6)].

- Do not administer as an intravenous push or bolus.

- Monitor blood counts at regular intervals.

- GAZYVA should only be administered by a healthcare professional with appropriate medical support to manage severe infusion reactions that can be fatal if they occur [see Warnings and Precautions (5.3)].

Chronic Lymphocytic Leukemia

Each dose of GAZYVA is 1000 mg, administered intravenously, with the exception of the first infusions in Cycle 1, which are administered on day 1 (100 mg) and day 2 (900 mg).
Table 1  Dose of GAZYVA to be Administered During Six 28-Day Treatment Cycles for Patients with CLL

<table>
<thead>
<tr>

<th>Rate of infusion</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Cycle 1</strong> (loading doses)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Day 1</td>
<td>100 mg</td>
<td>Administer at 25 mg/hr over 4 hours. Do not increase the infusion rate.</td>
</tr>
<tr>
<td>Day 2</td>
<td>900 mg</td>
<td>If no infusion reaction occurred during the previous infusion, administer at 50 mg/hr. The rate of the infusion can be escalated in increments of 50 mg/hr every 30 minutes to a maximum rate of 400 mg/hr. If an infusion reaction occurred during the previous infusion, administer at 25 mg/hr. The rate of infusion can be escalated in increments of up to 50 mg/hr every 30 minutes to a maximum rate of 400 mg/hr.</td>
</tr>
<tr>
<td>Day 8</td>
<td>1000 mg</td>
<td>If no infusion reaction occurred during the previous infusion and the final infusion rate was 100 mg/hr or faster, infusions can be started at a rate of 100 mg/hr and increased by 100 mg/hr increments every 30 minutes to a maximum of 400 mg/hr.</td>
</tr>
<tr>
<td>Day 15</td>
<td>1000 mg</td>
<td>If an infusion reaction occurred during the previous infusion, administer at 50mg/hr. The rate of infusion can be escalated in increments of 50mg/hr every 30 minutes to a maximum rate of 400mg/hr.</td>
</tr>
<tr>
<td><strong>Cycles 2–6</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Day 1</td>
<td>1000 mg</td>
<td>If an infusion reaction occurred during the previous infusion, administer at 50mg/hr. The rate of infusion can be escalated in increments of 50mg/hr every 30 minutes to a maximum rate of 400mg/hr.</td>
</tr>
</tbody>
</table>

If a planned dose of GAZYVA is missed, administer the missed dose as soon as possible and adjust dosing schedule to maintain the time interval between doses. If appropriate, patients who do not complete the Day 1 Cycle 1 dose may proceed to the Day 2 Cycle 1 dose.

**Follicular Lymphoma**

Each dose of GAZYVA is 1000 mg administered intravenously according to Table 2.

For patients with relapsed or refractory FL, administer GAZYVA in combination with bendamustine in six 28-day cycles. Patients who achieve stable disease, complete response, or partial response to the initial 6 cycles should continue on GAZYVA 1000 mg as monotherapy for up to two years.

For patients with previously untreated FL, administer GAZYVA with one of the following chemotherapy regimens:

- Six 28-day cycles in combination with bendamustine
- Six 21-day cycles in combination with CHOP, followed by 2 additional 21-day cycles of GAZYVA alone
- Eight 21-day cycles in combination with CVP

Patients with previously untreated FL who achieve a complete response or partial response to the initial 6 or 8 cycles should continue on GAZYVA 1000 mg as monotherapy for up to two years.
Table 2  Dose of GAZYVA to be Administered During 6-8 Treatment Cycles, Followed by GAZYVA Monotherapy for Patients with FL

<table>
<thead>
<tr>

<td>Day 1</td>
<td>1000 mg</td>
</tr>
<tr>
<td></td>
<td>Day 8</td>
<td>1000 mg</td>
</tr>
<tr>
<td></td>
<td>Day 15</td>
<td>1000 mg</td>
</tr>
<tr>
<td><strong>Cycles 2–6 or 2–8</strong></td>
<td>Day 1</td>
<td>1000 mg</td>
</tr>
<tr>
<td>Monotherapy</td>
<td>Every two months for up to two years</td>
<td>1000 mg</td>
</tr>
</tbody>
</table>

If a planned dose of GAZYVA is missed, administer the missed dose as soon as possible. During GAZYVA and chemotherapy treatment, adjust the dosing schedule accordingly to maintain the time interval between chemotherapy cycles. During monotherapy, maintain the original dosing schedule for subsequent doses. Monotherapy should be initiated approximately two months after the last dose of GAZYVA administered during the induction phase.

Management of Infusion Reactions in CLL and FL Patients

If a patient with CLL or FL experiences an infusion reaction of any grade during infusion, adjust the infusion as follows [see Warnings and Precautions (5.3)]:

- Grade 4 (life-threatening): Stop infusion immediately and permanently discontinue GAZYVA therapy.
- Grade 3 (severe): Interrupt infusion and manage symptoms. Upon resolution of symptoms, consider restarting GAZYVA infusion at no more than half the previous rate (the rate being used at the time that the infusion reaction occurred) and, if patient does not experience any further infusion reaction symptoms, infusion rate escalation may resume at the increments and intervals as appropriate for the treatment cycle dose. Permanently discontinue treatment if patients experience a Grade 3 infusion-related symptom at rechallenge.
  - For CLL patients only, the Day 1 infusion rate may be increased back up to 25 mg/hr after 1 hour but not increased further.
- Grade 1–2 (mild to moderate): Reduce infusion rate or interrupt infusion and treat symptoms. Upon resolution of symptoms, continue or resume infusion and, if patient does not experience any further infusion reaction symptoms, infusion rate escalation may resume at the increments and intervals as appropriate for the treatment cycle dose.
  - For CLL patients only, the Day 1 infusion rate may be increased back up to 25 mg/hr after 1 hour but not increased further.

2.2 Recommended Premedication for Infusion Reactions

Premedication to reduce the risk of infusion reactions is outlined in Table 3 [see Warnings and Precautions (5.3)].
Hypotension may occur during GAZYVA intravenous infusions. Consider withholding antihypertensive treatments for 12 hours prior to and throughout each GAZYVA infusion and for the first hour after administration [see Warnings and Precautions (5.3)].

</table>

<sup>1</sup> Hydrocortisone is not recommended as it has not been effective in reducing the rate of infusion reactions.

<sup>2</sup> If a glucocorticoid-containing chemotherapy regimen is administered on the same day as GAZYVA, the glucocorticoid can be administered as an oral medication if given at least 1 hour prior to GAZYVA, in which case additional intravenous glucocorticoid as premedication is not required.

### 2.3 Tumor Lysis Syndrome Prophylaxis

Patients with high tumor burden, high circulating absolute lymphocyte counts (greater than 25 x 10⁹/L) or renal impairment are considered at risk of tumor lysis syndrome and should receive prophylaxis. Premedicate with anti-hyperuricemics (e.g., allopurinol or rasburicase) and ensure adequate hydration prior to start of GAZYVA therapy. Continue prophylaxis prior to each subsequent GAZYVA infusion, as needed [see Warnings and Precautions (5.4)].
2.4 Antimicrobial Prophylaxis
Patients with Grade 3 to 4 neutropenia lasting more than one week are strongly recommended to receive antimicrobial prophylaxis until resolution of neutropenia to Grade 1 or 2. Antiviral and antifungal prophylaxis should be considered.

2.5 Treatment Interruption for Toxicity
Consider treatment interruption if patients experience an infection, Grade 3 or 4 cytopenia, or a ≥ Grade 2 non-hematologic toxicity.

2.6 Preparation and Administration

**Preparation**
Prepare the solution for infusion, using aseptic technique, as follows:
- Inspect visually for any particulate matter and discoloration prior to administration.
- Dilute into a 0.9% sodium chloride PVC or non-PVC polyolefin infusion bag. Do not use other diluents such as dextrose (5%).

**Chronic Lymphocytic Leukemia**
- Preparation of solution for infusion on day 1 (100 mg) and day 2 (900 mg) of Cycle 1:
  - Withdraw 40 mL of GAZYVA solution from the vial.
  - Dilute 4 mL (100 mg) of GAZYVA into a 100 mL 0.9% sodium chloride infusion bag for immediate administration.
  - Dilute the remaining 36 mL (900 mg) into a 250 mL 0.9% sodium chloride infusion bag at the same time for use on day 2 and store at 2°C to 8°C (36°F to 46°F) for up to 24 hours. After allowing the diluted bag to come to room temperature, use immediately.
  - Clearly label each infusion bag.
- Preparation of solution for infusion on day 8 and 15 of Cycle 1 and day 1 Cycles 2–6:
  - Withdraw 40 mL of GAZYVA solution from the vial.
  - Dilute 40 mL (1000 mg) into a 250 mL 0.9% sodium chloride infusion bag.

**Follicular Lymphoma**
- Preparation of solution for infusion:
  - Withdraw 40 mL of GAZYVA solution from the vial.
  - Dilute 40 mL (1000 mg) into a 250 mL 0.9% sodium chloride infusion bag.
- Mix diluted solution by gentle inversion. Do not shake or freeze.
- For microbiological stability, the diluted GAZYVA infusion solution should be used immediately. Dilute under appropriate aseptic conditions. If not used immediately, the solution may be stored in a refrigerator at 2°C to 8°C (36°F to 46°F) for up to 24 hours prior to use.

The product can be administered at a final concentration of 0.4 mg/mL to 4 mg/mL.

**Administration for CLL and FL Patients**
- Administer as an intravenous infusion only.
- Do not administer as an intravenous push or bolus.
- Do not mix GAZYVA with other drugs.
- No incompatibilities between GAZYVA and polyvinylchloride (PVC) or non-PVC polyolefin bags and administration sets have been observed [see How Supplied/Storage and Handling (16.1)].

3 DOSAGE FORMS AND STRENGTHS
1000 mg/40 mL (25 mg/mL) single-dose vial.
4 CONTRAINDICATIONS
GAZYVA is contraindicated in patients with known hypersensitivity reactions (e.g., anaphylaxis) to obinutuzumab or to any of the excipients, or serum sickness with prior obinutuzumab use [see Warnings and Precautions Section (5.4)].

5 WARNINGS AND PRECAUTIONS
5.1 Hepatitis B Virus Reactivation
Hepatitis B virus (HBV) reactivation, in some cases resulting in fulminant hepatitis, hepatic failure, and death, can occur in patients treated with anti-CD20 antibodies such as GAZYVA. HBV reactivation has been reported in patients who are hepatitis B surface antigen (HBsAg) positive and also in patients who are HBsAg negative but are hepatitis B core antibody (anti-HBc) positive. Reactivation has also occurred in patients who appear to have resolved hepatitis B infection (i.e., HBsAg negative, anti-HBc positive, and hepatitis B surface antibody [anti-HBs] positive).

HBV reactivation is defined as an abrupt increase in HBV replication manifesting as a rapid increase in serum HBV DNA level or detection of HBsAg in a person who was previously HBsAg negative and anti-HBc positive. Reactivation of HBV replication is often followed by hepatitis, i.e., increase in transaminase levels and, in severe cases, increase in bilirubin levels, liver failure, and death.

Screen all patients for HBV infection by measuring HBsAg and anti-HBc before initiating treatment with GAZYVA. For patients who show evidence of hepatitis B infection (HBsAg positive [regardless of antibody status] or HBsAg negative but anti-HBc positive), consult physicians with expertise in managing hepatitis B regarding monitoring and consideration for HBV antiviral therapy.

Monitor patients with evidence of current or prior HBV infection for clinical and laboratory signs of hepatitis or HBV reactivation during and for several months following treatment with GAZYVA. HBV reactivation has been reported for other CD20-directed cytolytic antibodies following completion of therapy.

In patients who develop reactivation of HBV while receiving GAZYVA, immediately discontinue GAZYVA and any concomitant chemotherapy and institute appropriate treatment. Resumption of GAZYVA in patients whose HBV reactivation resolves should be discussed with physicians with expertise in managing hepatitis B. Insufficient data exist regarding the safety of resuming GAZYVA in patients who develop HBV reactivation.

5.2 Progressive Multifocal Leukoencephalopathy
JC virus infection resulting in progressive multifocal leukoencephalopathy (PML), which can be fatal, was observed in patients treated with GAZYVA. Consider the diagnosis of PML in any patient presenting with new onset or changes to preexisting neurologic manifestations. Evaluation of PML includes, but is not limited to, consultation with a neurologist, brain MRI, and lumbar puncture. Discontinue GAZYVA therapy and consider discontinuation or reduction of any concomitant chemotherapy or immunosuppressive therapy in patients who develop PML.

5.3 Infusion Reactions
GAZYVA can cause severe and life-threatening infusion reactions. Sixty-five percent of patients with CLL experienced a reaction to the first 1000 mg of GAZYVA infused. Thirty-eight percent of patients with relapsed or refractory NHL and 60% of patients with previously untreated NHL experienced a reaction on Day 1 of GAZYVA infusion. Infusion reactions can also occur with subsequent infusions. Symptoms may include hypotension, tachycardia, dyspnea, and respiratory symptoms (e.g., bronchospasm, larynx and throat irritation, wheezing, laryngeal edema). The most frequently reported symptoms include nausea, fatigue, chest discomfort, dyspnea, dizziness, vomiting, diarrhea, rash, hypertension, hypotension, flushing, headache, pyrexia, and chills [see Adverse Reactions (6.1)].
Premedicate patients with acetaminophen, antihistamine, and a glucocorticoid. Institute medical management (e.g., glucocorticoids, epinephrine, bronchodilators, and/or oxygen) for infusion reactions as needed. Closely monitor patients during the entire infusion. Infusion reactions within 24 hours of receiving GAZYVA have occurred [see Dosage and Administration (2)].

For patients with any Grade 4 infusion reactions, including but not limited to anaphylaxis, acute life-threatening respiratory symptoms, or other life-threatening infusion reaction: Stop the GAZYVA infusion. Permanently discontinue GAZYVA therapy.

For patients with Grade 1, 2, or 3 infusion reactions: Interrupt GAZYVA for Grade 3 reactions until resolution of symptoms. Interrupt or reduce the rate of the infusion for Grade 1 or 2 reactions and manage symptoms [see Dosage and Administration (2)].

For patients with preexisting cardiac or pulmonary conditions, monitor more frequently throughout the infusion and the post-infusion period since they may be at greater risk of experiencing more severe reactions. Hypotension may occur as part of the GAZYVA infusion reaction. Consider withholding antihypertensive treatments for 12 hours prior to, during each GAZYVA infusion, and for the first hour after administration until blood pressure is stable. For patients at increased risk of hypertensive crisis, consider the benefits versus the risks of withholding their antihypertensive medication as is suggested here.

5.4 Hypersensitivity Reactions Including Serum Sickness

Hypersensitivity reactions have been reported in patients treated with GAZYVA. Signs of immediate-onset hypersensitivity included dyspnea, bronchospasm, hypotension, urticaria and tachycardia. Late-onset hypersensitivity diagnosed as serum sickness has also been reported, with symptoms that include chest pain, diffuse arthralgia and fever. Hypersensitivity reactions may be difficult to clinically distinguish from infusion related reactions. However, hypersensitivity very rarely occurs with the first infusion and, when observed, often occurs after previous exposure. If a hypersensitivity reaction is suspected during or after an infusion, the infusion must be stopped and treatment permanently discontinued. Patients with known hypersensitivity reactions to GAZYVA, including serum sickness, must not be retreated.

5.5 Tumor Lysis Syndrome

Tumor lysis syndrome (TLS), including fatal cases, has been reported in patients receiving GAZYVA. Patients with high tumor burden, high circulating lymphocyte count (> 25 x 10^9/L) or renal impairment are at greater risk for TLS and should receive appropriate tumor lysis prophylaxis with anti-hyperuricemics (e.g., allopurinol or rasburicase) and hydration prior to the infusion of GAZYVA [see Dosage and Administration (2.3)].

During the initial days of GAZYVA treatment, monitor the laboratory parameters of patients considered at risk for TLS. For treatment of TLS, correct electrolyte abnormalities, monitor renal function and fluid balance, and administer supportive care, including dialysis as indicated.

5.6 Infections

Fatal and serious bacterial, fungal, and new or reactivated viral infections can occur during and following GAZYVA therapy. When GAZYVA is administered with chemotherapy followed by GAZYVA monotherapy, Grade 3 to 5 infections have been reported in up to 8% of patients during combination therapy, up to 13% of patients during monotherapy, and up to 8% of patients after treatment [see Adverse Reactions (6.1)]. Do not administer GAZYVA to patients with an active infection. Patients with a history of recurring or chronic infections may be at increased risk of infection.
In GALLIUM, more Grade 3 to 5 infections were reported in the recipients of GAZYVA and bendamustine (117/410 patients, 29%), as compared to GAZYVA plus CHOP or CVP (43/281 patients, 15%). More fatal infections were reported in patients treated with GAZYVA and bendamustine (3%), as compared to GAZYVA plus CHOP or CVP (< 1%), including during the monotherapy phase and after completion of treatment.

5.7 Neutropenia
Severe and life threatening neutropenia, including febrile neutropenia, has been reported during treatment with GAZYVA. Monitor patients with Grade 3 to 4 neutropenia frequently with regular laboratory tests until resolution. Anticipate, evaluate, and treat any symptoms or signs of developing infection. Consider administration of granulocyte colony-stimulating factors (GCSF) in patients with Grade 3 or 4 neutropenia.

Neutropenia can also be of late onset (occurring more than 28 days after completion of treatment) and/or prolonged (lasting longer than 28 days).

Consider dose delays in the case of Grade 3 or 4 neutropenia. Patients with severe and long lasting (> 1 week) neutropenia are strongly recommended to receive antimicrobial prophylaxis until resolution of neutropenia to Grade 1 or 2. Consider antiviral and antifungal prophylaxis.

5.8 Thrombocytopenia
Severe and life threatening thrombocytopenia has been reported during treatment with GAZYVA in combination with chemotherapy. Fatal hemorrhagic events have been reported in patients with NHL and CLL treated with GAZYVA in combination with chemotherapy, including during Cycle 1.

Monitor all patients frequently for thrombocytopenia and hemorrhagic events, especially during the first cycle. In patients with Grade 3 or 4 thrombocytopenia, monitor platelet counts more frequently until resolution and consider subsequent dose delays of GAZYVA and chemotherapy or dose reductions of chemotherapy. Transfusion of blood products (i.e., platelet transfusion) may be necessary. Consider withholding concomitant medications, which may increase bleeding risk (platelet inhibitors, anticoagulants), especially during the first cycle.

5.9 Immunization
The safety and efficacy of immunization with live or attenuated viral vaccines during or following GAZYVA therapy have not been studied. Immunization with live virus vaccines is not recommended during treatment and until B-cell recovery.

6 ADVERSE REACTIONS
The following adverse reactions are discussed in greater detail in other sections of the label:

• Hepatitis B virus reactivation [see Warnings and Precautions (5.1)]
• Progressive multifocal leukoencephalopathy [see Warnings and Precautions (5.2)]
• Infusion reactions [see Warnings and Precautions (5.3)]
• Hypersensitivity reactions including serum sickness [see Warnings and Precautions (5.4)]
• Tumor lysis syndrome [see Warnings and Precautions (5.5)]
• Infections [see Warnings and Precautions (5.6)]
• Neutropenia [see Warnings and Precautions (5.7)]
• Thrombocytopenia [see Warnings and Precautions (5.8)]
6.1 Clinical Trial Experience

Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in practice.

Summary of Clinical Trial Experience in Chronic Lymphocytic Leukemia

The data described in Tables 4-5 below are based on a safety population of 773 previously untreated patients with CLL in the CLL11 study. Patients were treated with chlorambucil alone, GAZYVA in combination with chlorambucil, or rituximab product in combination with chlorambucil. The Stage 1 analysis compared GAZYVA in combination with chlorambucil vs. chlorambucil alone, and Stage 2 compared GAZYVA in combination with chlorambucil vs. rituximab product in combination with chlorambucil. Adverse reactions rates and laboratory abnormalities from the Stage 2 phase are presented below and are consistent with the rates in Stage 1. In addition to the adverse reactions observed in Stage 2, in Stage 1 back pain (5% vs. 2%), anemia (12% vs. 10%) and cough (10% vs. 7%) were observed at a higher incidence in the obinutuzumab treated patients. The incidence of Grade 3 to 4 back pain (<1% vs. 0%), cough (0% vs. <1%) and anemia (5% vs. 4%) was similar in both treatment arms. With regard to laboratory abnormalities, in Stage 1 hyperkalemia (33% vs. 18%), creatinine increased (30% vs. 20%) and alkaline phosphatase increased (18% vs. 11%) were observed at a higher incidence in patients treated with obinutuzumab with similar incidences of Grade 3 to 4 abnormalities between the two arms.

Patients received three 1000 mg doses of GAZYVA on the first cycle and a single dose of 1000 mg once every 28 days for 5 additional cycles in combination with chlorambucil (6 cycles of 28 days each in total). In the last 140 patients enrolled, the first dose of GAZYVA was split between day 1 (100 mg) and day 2 (900 mg) [see Dosage and Administration (2.1)]. In total, 81% of patients received all 6 cycles (of 28 days each) of GAZYVA-based therapy.

The most common adverse reactions (incidence ≥10%) observed in patients with CLL in the GAZYVA containing arm were infusion reactions, neutropenia, thrombocytopenia, anemia, pyrexia, cough, nausea, and diarrhea.

The most common Grade 3 to 4 adverse reactions (incidence ≥10%) observed in patients with CLL in the GAZYVA containing arm were neutropenia, infusion reactions, and thrombocytopenia.

Summary of Clinical Trial Experience in Non-Hodgkin Lymphoma

**GADOLIN**

The GADOLIN study evaluated safety in 392 patients with relapsed or refractory NHL, including FL (81%), small lymphocytic lymphoma and marginal zone lymphoma (a disease for which GAZYVA is not indicated), who did not respond to or progressed within 6 months of treatment with rituximab product or a rituximab product-containing regimen. In the population of patients with FL, the profile of adverse reactions was consistent with the overall NHL population. Patients were treated with either GAZYVA in combination with bendamustine, followed by GAZYVA monotherapy in patients that have not progressed, or with bendamustine alone.

Patients randomized to the GAZYVA + bendamustine arm received three weekly 1000 mg doses of GAZYVA in the first cycle and a single dose of 1000 mg once every 28 days for 5 additional cycles in combination with bendamustine 90 mg/m² on Days 1 and 2 in all 6 cycles. Patient randomized to the bendamustine alone arm received 120 mg/m² on Days 1 and 2. This regimen continued for 6 cycles of 28 days in duration. For patients who did not progress on GAZYVA in combination with bendamustine, a single dose of 1000 mg GAZYVA monotherapy was given every two months until progression or for a maximum of two years. During combination therapy with GAZYVA and bendamustine, 79% of patients received all 6 treatment cycles of GAZYVA and 76% received all 6 treatment cycles of bendamustine compared to 67% of patients in the bendamustine alone arm.

The most common adverse reactions (incidence ≥ 10%) observed in GADOLIN in the GAZYVA containing arm were infusion reactions, neutropenia, nausea, fatigue, cough, diarrhea, constipation, pyrexia, thrombocytopenia, vomiting, upper respiratory tract infection, decreased appetite, arthralgia, sinusitis, anemia, asthenia and urinary tract infection.

The most common Grade 3 to 4 adverse reactions (incidence ≥ 10%) observed in GADOLIN in the GAZYVA containing arm were neutropenia, thrombocytopenia and infusion reactions.

*a Defined as any related adverse reaction that occurred during or within 24 hours of infusion.

During the monotherapy period with GAZYVA, the most common adverse reactions (incidence ≥ 5%) in GADOLIN were cough (15%), upper respiratory tract infections (12%), neutropenia (11%), sinusitis (10%), diarrhea (8%), infusion related reactions (8%), nausea (8%), fatigue (8%), bronchitis (7%), arthralgia (7%), pyrexia (6%), nasopharyngitis (6%), and urinary tract infection (6%). Grade 3 to 4 adverse reactions during the monotherapy period included neutropenia (10%) and, at 1% each, anemia, febrile neutropenia, thrombocytopenia, sepsis, upper respiratory tract infection, and urinary tract infection.

In the monotherapy phase of treatment with GAZYVA, the most frequently reported hematological laboratory abnormalities (incidence ≥ 20%) were lymphopenia (80%), leukopenia (63%), low hemoglobin (50%), neutropenia (46%) and thrombocytopenia (35%). The most frequently reported hematological Grade 3 to 4 laboratory abnormalities (incidence ≥ 1%) during the monotherapy period were lymphopenia (52%), neutropenia (27%), leukopenia (20%) and thrombocytopenia (4%).

In the monotherapy phase of treatment with GAZYVA, the most frequently reported chemistry laboratory abnormalities (incidence ≥ 20%) were elevated creatinine (69%), decreased creatinine clearance (CrCl; 43%), hypophosphatemia (25%), AST/SGOT increased (24%) and ALT/SGPT increased (21%). The most frequently reported chemistry Grade 3 to 4 laboratory abnormalities (incidence ≥ 1%) during the monotherapy period were hypophosphatemia (5%), hyponatremia (3%) and decreased CrCl (1%).

**GALLIUM**

A randomized, open-label multicenter trial (GALLIUM) evaluated the safety of GAZYVA as compared to rituximab product in 1385 patients with previously untreated follicular lymphoma (86%) or marginal zone lymphoma (14%). Patients received chemotherapy (bendamustine, CHOP, or CVP) combined with either GAZYVA (691 patients) or rituximab product (694 patients), followed in responding patients by GAZYVA or rituximab product monotherapy every two months until disease progression or for a maximum of two years. The study excluded patients having an absolute neutrophil count (ANC) < 1500 / µL, platelets < 75,000 / µL, CrCl < 40 mL/min and, unless attributable to lymphoma, hepatic transaminases > 2.5 x upper limit of normal.

The median age was 60 (range: 23-88), 47% were male, 82% were white, and 97% had an ECOG performance status of 0 or 1. The chemotherapy was bendamustine in 59%, CHOP in 31% and CVP in 10% of patients. Following combination therapy, 624 patients (90%) in the GAZYVA arm and 612 patients (88%) in the rituximab product arm received monotherapy.

Serious adverse reactions occurred in 50% of patients on the GAZYVA arm and 43% of patients on the rituximab product arm. Fatal adverse reactions were reported during treatment in 3% in the GAZYVA arm and 2% in the rituximab product arm, most often from infections in the GAZYVA arm. During treatment and follow-up combined, fatal adverse reactions were reported in 5% of the GAZYVA arm and 4% of the rituximab product arm, with infections and second malignancies being leading causes. In the GAZYVA arm, fatal infections occurred in 2% of patients compared to < 1% in the rituximab product arm.

During combination therapy, 93% of patients received all treatment cycles in the GAZYVA arm, and 92% received all treatment cycles in the rituximab product arm. Of the responding patients who began monotherapy with GAZYVA or rituximab product, 76% and 73%, respectively, completed the full course. Dose modification due to adverse reactions occurred in 74% of the GAZYVA arm and 63% of the rituximab product arm throughout study treatment, and discontinuation of any study drug due to adverse reactions occurred in 18% and 15%, respectively.

Throughout treatment and follow-up, the most common adverse reactions (incidence ≥ 20%) observed at least 2% more in the GAZYVA arm included infusion related reactions, neutropenia, upper respiratory tract infection, cough, constipation and diarrhea (Table 8). Neutropenia, infusion related reactions, febrile neutropenia and thrombocytopenia were the most common Grade 3 to 5 adverse reactions (incidence ≥ 5%) observed more frequently in the GAZYVA arm.

*a* Includes adverse reactions reported throughout study treatment and follow-up.

*b* Includes grouped preferred terms.

*c* Except where noted, individual events that meet the definition of “infusion related reaction” are excluded from Table 8 above, as they are already included in the group term “Infusion Related Reaction”. The most common individual terms within the group term “Infusion Related Reaction” in decreasing order of frequency are nausea, chills, pyrexia and vomiting.

*d* Includes adverse reactions reported as infusion related reactions.

**Infusion related reactions** are defined as any related adverse reaction that occurred during or within 24 hours of infusion.

**Neutropenia** includes neutropenia, agranulocytosis, febrile neutropenia, granulocytopenia and neutrophil count decreased; **febrile neutropenia** includes febrile neutropenia, neutropenic infection, neutropenic sepsis, and febrile bone marrow aplasia.

**Thrombocytopenia** includes thrombocytopenia and platelet count decreased.

**Upper respiratory tract infection** includes upper respiratory tract congestion, upper respiratory tract inflammation, sinusitis bacterial, upper respiratory tract infection bacterial, pharyngitis streptococcal, sinusitis fungal, upper respiratory fungal infection, acute sinusitis, chronic sinusitis, laryngitis, nasopharyngitis, pharyngitis, rhinitis, sinusitis, tonsillitis, upper respiratory tract infection, rhinovirus infection, viral pharyngitis, viral rhinitis, viral upper respiratory tract infection.

**Herpesvirus infection** includes genital herpes, genital herpes zoster, herpes dermatitis, herpes ophthalmic, herpes simplex, herpes simplex pharyngitis, herpes virus infection, herpes zoster, herpes zoster disseminated, herpes zoster infection neurological, herpes zoster oticus, nasal herpes, ophthalmic herpes simplex, ophthalmic herpes zoster, oral herpes, varicella, varicella zoster virus infection.

**Pneumonia** includes pneumonia bacterial, pneumonia haemophilus, pneumonia pneumococcal, pneumonia fungal, pneumocystis jirovecii infection, pneumocystis jirovecii pneumonia, atypical pneumonia, lung infection, pneumonia, pneumonia aspiration, lung infiltration.

**Cough** includes cough, productive cough, upper-airway cough syndrome.

**Diarrhea** includes diarrhea, defecation urgency, frequent bowel movement, gastroenteritis, gastroenteritis viral.

**Headache** includes cluster headache, headache, sinus headache, tension headache, migraine.

**Insomnia** includes initial insomnia, insomnia, sleep disorder.

**Pruritus** includes pruritus and pruritus generalized.
During the monotherapy period, the common adverse reactions (incidence ≥ 10%) observed at least 2% more with GAZYVA were upper respiratory tract infection (40%), cough (23%), musculoskeletal pain (20%), neutropenia (19%) and herpesvirus infection (13%).

Table 9 summarizes treatment-emergent laboratory abnormalities during treatment and follow-up. The Grade 3 to 4 abnormalities reported at least 2% more in the GAZYVA arm were lymphopenia, leukopenia, neutropenia, thrombocytopenia and hyperuricemia. Patients in the GAZYVA arm, as compared to the rituximab product arm, had higher incidences of Grade 4 neutropenia (38% vs. 30%, respectively), Grade 4 lymphopenia (33% vs. 22%), and Grade 4 leukopenia (17% vs. 12%).

* Includes lab abnormalities, reported throughout treatment and follow-up, that were new or worsening, or worsening from baseline unknown.

In the monotherapy phase, new-onset Grade 3 or 4 neutropenia was reported in 21% of patients in the GAZYVA arm (Grade 4, 10%) and 17% of patients in the rituximab product arm (Grade 4, 9%).

Infusion Reactions:

Chronic Lymphocytic Leukemia

The incidence of infusion reactions in the CLL11 study was 65% with the first infusion of GAZYVA. The incidence of Grade 3 or 4 infusion reactions was 20% with 7% of patients discontinuing therapy. The incidence of reactions with subsequent infusions was 3% with the second 1000 mg and < 1% thereafter. No Grade 3 or 4 infusion reactions were reported beyond the first 1000 mg infused.
Of the first 53 patients receiving GAZYVA in CLL11, 47 (89%) experienced an infusion reaction. After this experience, study protocol modifications were made to require pre-medication with a corticosteroid, antihistamine, and acetaminophen. The first dose was also divided into two infusions (100 mg on day 1 and 900 mg on day 2). For the 140 patients for whom these mitigation measures were implemented, 74 patients (53%) experienced a reaction with the first 1000 mg (64 patients on day 1, 3 patients on day 2, and 7 patients on both days) and < 3% thereafter [see Dosage and Administration (2)].

Non-Hodgkin Lymphoma

Overall, 69% of patients in the GADOLIN study experienced an infusion reaction (all grades) during treatment with GAZYVA in combination with bendamustine. The incidence of Grade 3 to 4 infusion reactions in GADOLIN was 11%. In Cycle 1, the incidence of infusion reactions (all grades) was 55% in patients receiving GAZYVA in combination with bendamustine with Grade 3 to 4 infusion reactions reported in 9%. In patients receiving GAZYVA in combination with bendamustine, the incidence of infusion reactions was highest on Day 1 (38%), and gradually decreased on Days 2, 8 and 15 (25%, 7% and 4%, respectively).

During Cycle 2, the incidence of infusion reactions was 24% in patients receiving GAZYVA in combination with bendamustine and decreased with subsequent cycles.

During GAZYVA monotherapy in GADOLIN, infusion reactions (all grades) were observed in 8% of patients. No Grade 3 to 4 infusion reactions were reported during GAZYVA monotherapy.

Overall, 2% of patients in GADOLIN experienced an infusion reaction leading to discontinuation of GAZYVA.

In GALLIUM, 72% of patients in the GAZYVA treated arm experienced an infusion reaction (all grades). The incidence of Grade 3 to 4 infusion reactions for these patients was 12%. In Cycle 1, the incidence of infusion reactions (all grades) was 62% in the GAZYVA treated arm with Grade 3 to 4 infusion reactions reported in 10%. The incidence of infusion reactions (all grades) was highest on Day 1 (60%), and decreased on Days 8 and 15 (9% and 6%, respectively).

During Cycle 2, the incidence of infusion reactions (all grades) in the GAZYVA treated arm was 13% and decreased with subsequent cycles.

During GAZYVA monotherapy treatment in GALLIUM, infusion reactions (all grades) were observed in 9% of patients.

Overall, 1% of patients in GALLIUM experienced an infusion reaction leading to discontinuation of GAZYVA.

Neutropenia:

Chronic Lymphocytic Leukemia

The incidence of neutropenia reported as an adverse reaction in CLL11 was 38% in the GAZYVA treated arm and 32% in the rituximab product treated arm, with the incidence of serious adverse reactions being 1% and < 1%, respectively (Table 4). Cases of late-onset neutropenia (occurring 28 days after completion of treatment or later) were 16% in the GAZYVA treated arm and 12% in the rituximab product treated arm.

Non-Hodgkin Lymphoma

The incidence of neutropenia in GADOLIN was higher in the GAZYVA plus bendamustine arm (38%) compared to the arm treated with bendamustine alone (32%). Cases of prolonged neutropenia (3%) and late onset neutropenia (7%) were also reported in the GAZYVA plus bendamustine arm. The incidence of neutropenia was higher during treatment with GAZYVA in combination with bendamustine (31%) compared to the GAZYVA monotherapy treatment phase (12%).
The incidence of neutropenia in GALLIUM was higher in the GAZYVA treated arm (53%) compared to the rituximab product treated arm (47%). Cases of prolonged neutropenia (1%) and late onset neutropenia (4%) were also reported in the GAZYVA treated arm. The incidence of neutropenia was higher during treatment with GAZYVA in combination with chemotherapy (45%) compared to the GAZYVA monotherapy treatment phase (20%).

Infection:

Chronic Lymphocytic Leukemia

The incidence of infections was similar between GAZYVA and rituximab product treated arms. Thirty-eight percent of patients in the GAZYVA treated arm and 37% in the rituximab product treated arm experienced an infection, with Grade 3 to 4 rates being 11% and 13%, respectively. Fatal events were reported in 1% of patients in both arms.

Non-Hodgkin Lymphoma

The incidence of infection in GADOLIN was 66% in the GAZYVA plus bendamustine arm and 56% in the bendamustine arm, with Grade 3 to 4 events reported in 16% and 14%, respectively. Fatal events were reported in 3% of patients in the GAZYVA plus bendamustine arm and 4% in the bendamustine arm.

The incidence of infections in GALLIUM was 82% in the GAZYVA treated arm and 73% in the rituximab product treated arm, with Grade 3 to 4 events reported in 21% and 17%, respectively. In the GAZYVA arm, fatal infections occurred in 2% of patients compared to <1% in the rituximab product arm.

The incidence of Grade 3 to 4 infections in the GAZYVA and rituximab product treated arms was lower in patients receiving GCSF prophylaxis (14%; 16%) compared with patients not receiving GCSF prophylaxis (24%; 18%). The incidence of fatal infections in patients receiving GCSF prophylaxis in the GAZYVA and rituximab product treated arms was 2% and 0%, respectively, and was 2% and <1% in patients not receiving GCSF prophylaxis.

Thrombocytopenia:

Chronic Lymphocytic Leukemia

The overall incidence of thrombocytopenia reported as an adverse reaction was higher in the GAZYVA treated arm (14%) compared to the rituximab product treated arm (7%), with the incidence of Grade 3 to 4 events being 10% and 3%, respectively (Table 4). The difference in incidences between the treatment arms is driven by events occurring during the first cycle. The incidence of thrombocytopenia (all grades) in the first cycle was 11% in the GAZYVA and 3% in the rituximab product treated arms, with Grade 3 to 4 rates being 8% and 2%, respectively. Four percent of patients in the GAZYVA treated arm experienced acute thrombocytopenia (occurring within 24 hours after the GAZYVA infusion).

The overall incidence of hemorrhagic events and the number of fatal hemorrhagic events were similar between the treatment arms, with 3 in the rituximab product and 4 in the GAZYVA treated arms. However, all fatal hemorrhagic events in patients treated with GAZYVA occurred in Cycle 1.

Non-Hodgkin Lymphoma

The incidence of thrombocytopenia in GADOLIN was lower in the GAZYVA plus bendamustine arm (15%) compared to the arm treated with bendamustine alone (24%). The incidence of hemorrhagic events in GAZYVA plus bendamustine treated patients compared to bendamustine alone was 11% and 10%, respectively. Grade 3 to 4 hemorrhagic events were similar in both treatment arms (5% in the GAZYVA plus bendamustine arm and 3% in the bendamustine arm).
In GALLIUM, thrombocytopenia was reported as an adverse reaction in 14% of the GAZYVA treated arm and 8% of the rituximab product treated arm, with the incidence of Grade 3 to 4 events being 7% and 3% respectively. The difference in incidences between the treatment arms is driven by events occurring during the first cycle. The incidence of thrombocytopenia (all grades) in the first cycle were 9% in the GAZYVA and 3% in the rituximab product treated arms, with Grade 3 to 4 rates being 5% and 1%, respectively. In GALLIUM, both treatment arms had a 12% overall incidence of hemorrhagic events and a < 1% incidence of fatal hemorrhagic events.

Tumor Lysis Syndrome: The incidence of Grade 3 or 4 tumor lysis syndrome in GAZYVA treated patients was 2% in CLL11, 0.5% in GADOLIN and 0.9% in GALLIUM.

Musculoskeletal Disorders:

Chronic Lymphocytic Leukemia

Adverse reactions related to musculoskeletal disorders (all events from the body system), including pain, have been reported in the GAZYVA treated arm with higher incidence than in the rituximab product treated arm (18% vs. 15%).

Non-Hodgkin Lymphoma

In GADOLIN, adverse reactions related to musculoskeletal disorders (all events from the body system), including pain, have been reported in the GAZYVA plus bendamustine treated arm with higher incidence than in the bendamustine alone arm (41% vs. 29%).

In GALLIUM, musculoskeletal disorders were reported in 54% of patients in the GAZYVA treated arm and 49% of patients in the rituximab product treated arm.

Liver Enzyme Elevations: Hepatic enzyme elevations have occurred in CLL patients who received GAZYVA in clinical trials and had normal baseline hepatic enzyme levels (AST, ALT and ALP). The events occurred most frequently within 24–48 hours of the first infusion. In some patients, elevations in liver enzymes were observed concurrently with infusion reactions or tumor lysis syndrome. In the CLL11 study, there was no clinically meaningful difference in overall hepatotoxicity adverse reactions between all arms (4% of patients in the GAZYVA treated arm). Medications commonly used to prevent infusion reactions (e.g., acetaminophen) may also be implicated in these events. Monitor liver function tests during treatment, especially during the first cycle. Consider treatment interruption or discontinuation for hepatotoxicity.

Gastrointestinal Perforation: Cases of gastrointestinal perforation have been reported in patients receiving GAZYVA, mainly in NHL.

Worsening of Pre-existing Cardiac Conditions: Fatal cardiac events have been reported in patients treated with GAZYVA.

6.2 Immunogenicity

As with all therapeutic proteins, there is potential for immunogenicity. The detection of antibody formation is highly dependent on the sensitivity and specificity of the assay. Additionally, the observed incidence of antibody (including neutralizing antibody) positivity in an assay may be influenced by several factors including assay methodology, sample handling, timing of sample collection, concomitant medications, and underlying disease. For these reasons, comparison of the incidence of antibodies to GAZYVA in the studies described below with the incidence of antibodies in other studies or to other products may be misleading.

Seven percent (18/271) of patients with CLL tested positive for anti-GAZYVA antibodies at one or more time points in CLL11. No patients developed anti-GAZYVA antibodies during or following
GAZYVA treatment in GADOLIN, while 1 patient (1/564, 0.2%) developed anti-GAZYVA antibodies in GALLIUM. Neutralizing activity of anti-GAZYVA antibodies has not been assessed.

6.3 Postmarketing Safety Information
The following adverse reactions have been identified during post-approval use of GAZYVA.

- Immune/Autoimmune Events: Serum sickness

USE IN SPECIFIC POPULATIONS
8.1 Pregnancy
Risk Summary
GAZYVA is likely to cause fetal B-cell depletion based on findings from animal studies and the drug’s mechanism of action [see Clinical Pharmacology (12.1)]. There are no data with GAZYVA use in pregnant women to inform a drug-associated risk. Monoclonal antibodies are transferred across the placenta. In animal reproduction studies, weekly intravenous administration of obinutuzumab to pregnant cynomolgus monkeys from day 20 of pregnancy until parturition which includes the period of organogenesis at doses with exposures up to 2.4 times the exposure at the clinical dose of 1000 mg monthly produced opportunistic infections and immune complex mediated hypersensitivity reactions. No embryo-toxic or teratogenic effects were observed in the monkeys (see Data). Consider the potential risk to the fetus when prescribing GAZYVA to a pregnant woman.

The background risk of major birth defects and miscarriage for the indicated population is unknown; however, the estimated background risk in the U.S. general population of major birth defects is 2% to 4% and of miscarriage is 15% to 20% of clinically recognized pregnancies.

Clinical Considerations
Fetal/Neonatal Adverse Reactions
GAZYVA is likely to cause fetal B-cell depletion (see Data). Avoid administering live vaccines to neonates and infants exposed to GAZYVA in utero until B-cell recovery occurs [see Warnings and Precautions (5.8) and Clinical Pharmacology (12.2)].

Data
Animal Data
In a pre- and post-natal development study, pregnant cynomolgus monkeys received weekly intravenous doses of 25 or 50 mg/kg obinutuzumab from day 20 of pregnancy until parturition, which includes the period of organogenesis. The high dose results in an exposure (AUC) that is 2.4 times the exposure in patients with CLL at the recommended label dose. There were no embryo-toxic or teratogenic effects in animals. Secondary opportunistic infections, immune complex mediated hypersensitivity reactions, or a combination of both were observed in exposed dams. When first measured on day 28 postpartum, obinutuzumab was detected in offspring at levels in the range of maternal serum levels on the same day, and B-cells were completely depleted. The B-cell counts returned to normal levels, and immunologic function was restored within 6 months after birth.

Obinutuzumab was measured in the milk of lactating cynomolgus monkeys on day 28 postpartum after weekly intravenous administration from day 20 of pregnancy until parturition. Concentrations in milk were approximately 0.04% and 0.13% of concentrations in maternal serum in the 25 and 50 mg/kg groups, respectively.
8.2 Lactation
Risk Summary

There is no information regarding the presence of GAZYVA in human milk, the effects on the breastfed child, or the effects on milk production. However, low levels of obinutuzumab were present in the milk of lactating cynomolgus monkeys [see Use in Specific Populations (8.1)]. Human IgG is known to be present in human milk. Published data suggest that antibodies in breast milk do not enter the neonatal and child circulations in substantial amounts. The developmental and health benefits of breastfeeding should be considered along with the mother’s clinical need for GAZYVA and any potential adverse effects on the breastfed child from GAZYVA or from the underlying maternal condition.

8.4 Pediatric Use
The safety and effectiveness of GAZYVA in pediatric patients have not been established.

8.5 Geriatric Use
Chronic Lymphocytic Leukemia

Of 336 patients with previously untreated CLL who received GAZYVA in combination with chlorambucil, 81% were 65 years and older, while 46% were 75 and older. Of the patients 75 years and older, 46% experienced serious adverse reactions and 7% experienced adverse reactions leading to death. Of the patients younger than 75, 33% experienced a serious adverse reaction and 2% an adverse reaction leading to death. No significant differences in efficacy were observed between younger and older patients [see Clinical Studies (14.1)].

Non-Hodgkin Lymphoma

Of 194 patients in GADOLIN with relapsed or refractory NHL treated with GAZYVA plus bendamustine, 44% were 65 and over, while 14% were 75 and over. In patients 65 and over, 52% of patients experienced serious adverse reactions and 26% experienced adverse reactions leading to treatment withdrawal while in patients under 65, 28% and 12% experienced serious adverse reactions and adverse reactions leading to treatment withdrawal, respectively. No clinically meaningful differences in efficacy were observed between these patients and younger patients in GADOLIN.

Of the 691 patients in GALLIUM treated with GAZYVA plus chemotherapy as first-line therapy, 33% were 65 and over, while 7% were 75 and over. Of patients 65 and over, 63% experienced serious adverse reactions and 26% experienced adverse reactions leading to treatment withdrawal, while in patients under 65, 43% experienced serious adverse reactions and 13% had an adverse reaction leading to treatment withdrawal. No clinically meaningful differences in efficacy were observed between these patients and younger patients in GALLIUM.

10 OVERDOSAGE
There has been no experience with overdose in human clinical trials. For patients who experience overdose, treatment should consist of immediate interruption or reduction of GAZYVA and supportive therapy.

11 DESCRIPTION
GAZYVA (obinutuzumab) is a humanized anti-CD20 monoclonal antibody of the IgG1 subclass. It recognizes a specific epitope of the CD20 molecule found on B cells. The molecular mass of the antibody is approximately 150 kDa.

GAZYVA is produced by mammalian cell (CHO) suspension culture. GAZYVA was engineered for reduced fucosylation as compared to a typical IgG1 produced in CHO cells. GAZYVA is a sterile, clear, colorless to slightly brown, preservative-free liquid concentrate for intravenous administration. GAZYVA is supplied at a concentration of 25 mg/mL in 1000 mg single-dose vials. The product is
formulated in 20 mM L-histidine/L-histidine hydrochloride, 240 mM trehalose, 0.02% poloxamer 188. The pH is 6.0.

12 CLINICAL PHARMACOLOGY

12.1 Mechanism of Action

Obinutuzumab is a monoclonal antibody that targets the CD20 antigen expressed on the surface of pre-B and mature B lymphocytes. Upon binding to CD20, obinutuzumab mediates B-cell lysis through (1) engagement of immune effector cells, (2) by directly activating intracellular death signaling pathways (direct cell death), and/or (3) activation of the complement cascade. The immune effector cell mechanisms include antibody-dependent cellular cytotoxicity (ADCC) and antibody-dependent cellular phagocytosis.

As an antibody with reduced fucose content, obinutuzumab induces greater ADCC activity than rituximab in vitro using human cancer cell lines. Obinutuzumab also demonstrated an increased ability to induce direct cell death when compared to rituximab. Obinutuzumab binds to FcγRIII using purified proteins with a higher affinity than rituximab. Obinutuzumab and rituximab bind with similar affinity to overlapping epitopes on CD20.

12.2 Pharmacodynamics

In patients with CLL, GAZYVA caused CD19 B-cell depletion (defined as CD19 B cell counts < 0.07 x 10⁹/L). Initial CD19 B cell recovery was observed in some patients approximately 9 months after the last GAZYVA dose. At 18 months of follow-up, some patients remain B cell depleted.

Although the depletion of B cells in the peripheral blood is a measurable pharmacodynamic effect, it is not directly correlated with the depletion of B-cells in solid organs or in malignant deposits. B cell depletion has not been shown to be directly correlated to clinical response.

Cardiac Electrophysiology

The potential effects of GAZYVA on the QTc interval have not been studied.

12.3 Pharmacokinetics

The pharmacokinetic parameters of obinutuzumab after 100 mg on day 1 and 900 mg on day 2 of Cycle 1, 1000 mg on day 8 and 15 of Cycle 1, and 1000 mg on day 1 of Cycles 2–6 for CLL and after 1000 mg on day 1, 8 and 15 of Cycle 1, 1000 mg on day 1 of Cycles 2-6 or Cycles 2-8, and then 1000 mg every 2 months for up to 2 years for NHL are provided in Table 10. The dosing regimen is within the linear pharmacokinetic behavior of obinutuzumab.

α Induction Cycle 6 of a 28-day cycle;

β Induction Cycle 8 of a 21-day cycle.

Elimination

The elimination of obinutuzumab is comprised of a linear clearance pathway and a time-dependent non-linear clearance pathway. As GAZYVA treatment progresses, the impact of the time-dependent
pathway diminishes in a manner suggesting target-mediated drug disposition (TMDD) and saturation of the TMDD at the end of the treatment cycle at the proposed clinical dose regimen. The pharmacokinetic properties of obinutuzumab in patients with CLL and NHL are provided in Table 11.

Specific Populations

Age (median [range]: 63 [22, 89] years) and baseline creatinine clearance (CrCL) (median [range] 84 [22, >120] mL/min) did not affect the pharmacokinetics of GAZYVA. In patients with CrCL ≤ 30 mL/min, the pharmacokinetics of GAZYVA was unaffected. GAZYVA has not been studied in patients with hepatic impairment.

The volume of distribution and steady-state clearance increased with body weight; however, the expected change in exposure does not warrant a dose modification.

13  NONCLINICAL TOXICOLOGY

13.1  Carcinogenesis, Mutagenesis, Impairment of Fertility

No carcinogenicity or genotoxicity studies have been conducted with obinutuzumab.

No specific studies have been conducted to evaluate potential effects on fertility; however, no adverse effects on male or female reproductive organs were observed in the 26-week repeat-dose toxicity study in cynomolgus monkeys.

14  CLINICAL STUDIES

14.1  Chronic Lymphocytic Leukemia

GAZYVA was evaluated in a three-arm, open-label, active-controlled, randomized, multicenter trial (CLL11; NCT01010061) in 781 patients with previously untreated CD20+ CLL requiring treatment who had coexisting medical conditions or reduced renal function as measured by creatinine clearance (CrCl) < 70 mL/min. Patients with CrCl < 30 mL/min, active infections, positive hepatitis B (HBsAg or anti-HBc positive; patients positive for anti-HBc could be included if hepatitis B viral DNA was not detectable) and hepatitis C serology, or immunization with live virus vaccine within 28 days prior to randomization were excluded from the trial. Patients were treated with chlorambucil control (Arm 1), GAZYVA in combination with chlorambucil (Arm 2), or rituximab product in combination with chlorambucil (Arm 3). The safety and efficacy of GAZYVA was evaluated in a Stage 1 comparison of Arm 1 vs. Arm 2 in 356 patients and a Stage 2 comparison of Arm 2 vs. Arm 3 in 663 patients.

The majority of patients received 1000 mg of GAZYVA on days 1, 8 and 15 of the first cycle, followed by treatment on the first day of 5 subsequent cycles (total of 6 cycles, 28 days each). The first dose of GAZYVA was divided between day 1 (100 mg) and day 2 (900 mg) [see Dosage and
Administration (2.1)], which was implemented in 140 patients. Chlorambucil was given orally at 0.5 mg/kg on day 1 and day 15 of all treatment cycles (1 to 6).

In CLL11, the median age was 73 years, 62% were male, and 95% were Caucasian. Sixty-five percent had a CrCl < 70 mL/min and 76% had multiple coexisting medical conditions. Twenty-two percent of patients were Binet stage A, 42% were stage B, and 36% were stage C. The median estimated CrCl was 62 mL/min. Eighty-one percent of patients treated with GAZYVA in combination with chlorambucil received all 6 cycles compared to 89% of patients in the rituximab product treated arm and 67% in the chlorambucil alone arm.

In the Stage 1 analysis of CLL11, the median progression-free survival (PFS) in the GAZYVA in combination with chlorambucil arm was 27.2 months and 11.2 months in the chlorambucil alone arm (median observation time 22.8 months) as assessed by independent review and is consistent with investigator-assessed PFS. The median overall survival (OS) was not yet reached with a total of 46 deaths: 22 (9%) in the GAZYVA in combination with chlorambucil arm and 24 (20%) in the chlorambucil arm. The hazard ratio for OS was 0.41 (95% CI: 0.23-0.74).

In the Stage 2 analysis of CLL11, the median PFS was 26.7 months in the GAZYVA arm and 14.9 months in the rituximab product arm with a median observation time of 18.7 months (HR: 0.42, 95% CI: 0.33-0.54, p-value < 0.0001). These results were assessed by independent review and are consistent with investigator-assessed PFS. Minimal residual disease (MRD) was evaluated using allele-specific oligonucleotide polymerase chain reaction (ASO-PCR). The cutoff for a negative status was one CLL cell per 10^4 leukocytes in the sample (i.e., an MRD value of < 10^−4 was considered negative). Among patients who achieved complete response (CR) and complete response with incomplete marrow recovery (CRi; 94 patients in the GAZYVA arm and 34 patients in the rituximab product arm), 18 patients (19%) had negative MRD in the bone marrow in the GAZYVA arm compared to 2 patients (6%) in the rituximab product arm. Out of the patients who achieved CR and CRi, 39 patients (41%) in the GAZYVA arm, and 4 patients (12%) in the rituximab product arm were MRD negative in peripheral blood samples collected at least 3 months after the end of treatment.

Efficacy results are shown in Table 12, and the Kaplan-Meier curves for Stage 1a Overall Survival and Stage 2 PFS are shown in Figures 1 and 2, respectively.

14.2 Follicular Lymphoma

GADOLIN (NCT01059630) is an open-label, multicenter, randomized study including 321 patients with follicular lymphoma (FL) who had no response to or have progressed during or within 6 months of rituximab product or a rituximab product -containing regimen. These patients were randomized to receive either bendamustine alone (n = 166) or GAZYVA in combination with bendamustine (n = 155) for 6 cycles, each of 28 days duration. Patients in the GAZYVA plus bendamustine arm who did not have disease progression [patients with a complete response (CR), partial response (PR) or stable disease (SD)] at the end of the 6 cycles continued receiving GAZYVA monotherapy for 2 years. Patients were stratified according to the type of refractoriness to rituximab product (refractory to rituximab product monotherapy versus rituximab product in combination with chemotherapy) and the number of prior therapies (≤ 2 versus > 2).

GAZYVA was given by intravenous infusion as a flat dose of 1000 mg on Days 1, 8 and 15 of Cycle 1, on Day 1 of Cycles 2–6, and then every 2 months until disease progression for up to 2 years. Bendamustine was given intravenously on Days 1 and 2 for all treatment cycles (1–6) at 90 mg/m²/day when given in combination with GAZYVA or 120 mg/m²/day when given alone.

In GADOLIN, patients had a median age of 63 years, 88% were Caucasian, and 56% were male. Thirty-four percent had bulky disease (> 6 cm), 15% had at least one B-symptom at baseline and 95% had an ECOG performance status of 0–1 at baseline. The median time since initial diagnosis was 3 years and the median number of prior therapies was 2 (range 1 to 10). Forty-six percent of patients received 1 prior therapy and 33% of patients received 2 prior therapies. Twenty percent of patients were refractory to prior rituximab product monotherapy, 37% of patients were refractory to prior rituximab product plus chemotherapy induction treatment, and 41% of patients were refractory to rituximab product maintenance treatment received following rituximab product plus chemotherapy induction. Seventy-nine percent of patients were refractory to both rituximab product and an alkylating agent during any prior regimen (double refractory).

The primary objective of the study was to evaluate PFS as determined by an independent review committee (IRC). Median observation time was 21.1 months. The median PFS in the bendamustine arm was 13.8 months. Median PFS was not reached in the GAZYVA plus bendamustine arm (PFS HR = 0.48, 95% CI: 0.34-0.68; stratified log-rank test p-value < 0.0001). The investigator assessed PFS result was consistent with the IRC-assessed PFS. The median investigator-assessed PFS in the bendamustine arm was 13.7 months and the median in the GAZYVA containing arm was 29.2 months (PFS HR = 0.48, 95% CI: 0.35-0.67; stratified log-rank test p-value < 0.0001). Efficacy results are summarized in Table 13. Kaplan-Meier curves for PFS are shown in Figure 3.

An analysis conducted with 24.1 months of median observation time revealed that the median overall survival was not yet reached in either arm. Kaplan-Meier curves for OS are shown in Figure 4.

Kaplan-Meier Curve of Progression-Free Survival in Patients with FL
GALLIUM

GALLIUM (NCT01332968) is a multicenter, open-label, randomized study including 1202 patients with previously untreated, stage II bulky, III or IV FL. Patients were randomized 1:1 to receive either GAZYVA (n = 601) or rituximab product (n = 601) in combination with chemotherapy (CHOP, CVP, or bendamustine) for 6–8 cycles. Patients were stratified by chemotherapy (selected by each site; all patients at that site received the chosen chemotherapy regimen), FLIPI (Follicular Lymphoma International Prognostic Index) risk group and geographic region. Patients with at least PR to combination therapy received monotherapy with GAZYVA (1000 mg) or rituximab product every two months until disease progression or for a maximum of two years. The study excluded patients with follicular lymphoma grade 3b or transformed disease; patients having an ANC < 1500 / µL, platelets < 75,000 / µL, or CrCl < 40 mL/min; and patients with hepatic transaminases > 2.5 x upper limit of normal unless attributable to lymphoma.

GAZYVA was given by intravenous infusion as a flat dose of 1000 mg on Days 1, 8 and 15 of cycle 1 and Day 1 of subsequent treatment cycles.

GAZYVA and bendamustine were given in six 28-day cycles. Bendamustine was administered at 90 mg/m²/day on Days 1 and 2 of each cycle, with prednisone 100 mg orally or equivalent on Day 1 of Cycle 1.

GAZYVA and CHOP were given in six 21-day cycles. Subsequently, two additional cycles of GAZYVA were given for a total of 8 GAZYVA cycles. CHOP consisted of cyclophosphamide 750 mg/m² intravenously, doxorubicin 50 mg/m², and vincristine 1.4 mg/m² (maximum dose, 2 mg) on Day 1 and prednisone 100 mg orally on Days 1-5.

GAZYVA and CVP were given in eight 21-day cycles. CVP consisted of cyclophosphamide 750 mg/m² intravenously and vincristine 1.4 mg/m² (maximum dose, 2 mg) on Day 1 and prednisone 100 mg orally on Days 1-5.

Patients had a median age of 59 years, 81% were Caucasian, and 53% were female; 7% had Stage II, 35% had Stage III, and 56% had Stage IV disease, with 44% having bulky disease (≥ 7 cm) overall;
79% had a FLIPI score of > 2; and 97% had an ECOG performance status of 0–1. The chemotherapy was bendamustine in 57%, CHOP in 33%, and CVP in 10% of patients.

Efficacy was based on PFS per IRC, with a median observation time of 38 months. Upon interim analysis, the risk of progression or death was significantly reduced in the GAZYVA containing arm compared to the rituximab product containing arm (Table 14). Kaplan-Meier curves for PFS are shown in Figure 5. Overall response and complete remission rates were similar.

16 HOW SUPPLIED/STORAGE AND HANDLING
16.1 How Supplied/Storage
GAZYVA 1000 mg/40 mL (25 mg/mL) single-dose vials containing preservative-free solution (NDC 50242-070-01) are stable at 2°C to 8°C (36°F to 46°F). Do not use beyond expiration date stamped on carton. Protect GAZYVA vials from light. DO NOT FREEZE. DO NOT SHAKE.

For the diluted product, chemical and physical stability have been demonstrated in 0.9% NaCl at concentrations of 0.4 mg/mL to 20 mg/mL for 24 hours at 2°C to 8°C (36°F to 46°F) followed by 48 hours (including infusion time) at room temperature (≤ 30°C/86°F). GAZYVA does not contain antimicrobial preservatives. Therefore, care must be taken to ensure that the solution for infusion is not microbiologically compromised during preparation. The solution for infusion should be used immediately. If not used immediately, the prepared solution may be stored up to 24 hours at 2 to 8°C. No incompatibilities between GAZYVA and polyvinyl chloride or polyolefin infusion materials have been observed in concentration ranges from 0.4 mg/mL to 20.0 mg/mL after dilution of GAZYVA with 0.9% sodium chloride.

17 PATIENT COUNSELING INFORMATION
Advisce patients to seek immediate medical attention for any of the following:

- Signs and symptoms of infusion reactions including dizziness, nausea, chills, fever, vomiting, diarrhea, breathing problems, or chest pain [see Warnings and Precautions (5.3) and Adverse Reactions (6.1)].
- Symptoms of tumor lysis syndrome such as nausea, vomiting, diarrhea, and lethargy [see Warnings and Precautions (5.5) and Adverse Reactions (6.1)].
• Signs of infections including fever and cough [see Warnings and Precautions (5.6) and Adverse Reactions (6.1)].

• Symptoms of hepatitis including worsening fatigue or yellow discoloration of skin or eyes [see Warnings and Precautions (5.1)].

• New or changes in neurological symptoms such as confusion, dizziness or loss of balance, difficulty talking or walking, or vision problems [see Warnings and Precautions (5.2)].

Advise patients of the need for:

• Periodic monitoring of blood counts [see Warnings and Precautions (5.7 and 5.8) and Adverse Reactions (6.1)].

• Avoid vaccinations with live viral vaccines [see Warnings and Precautions (5.9)].

• Patients with a history of hepatitis B infection (based on the blood test) should be monitored and sometimes treated for their hepatitis [see Warnings and Precautions (5.1)].

Advise pregnant women of potential fetal B-cell depletion [see Use in Specific Populations (8.1)].
